Gluing blockwise martingale decompositions across seams

P / partially_solved | AIM 研讨会问题汇编

Problem 21. Can one use function spaces to get martingale decompositions and concatenations for some class of hyperbolic maps?

Can one use generalized function spaces to get martingales for concatenations of random hyperbolic maps?

No mathematical symbols are missing.

This is a repeated workshop question. On the preceding day, Problem 15 asked:

Problem 21 replaces “generalized function spaces” by “function spaces” and “martingales for concatenations” by “martingale decompositions and concatenations,” but the research intent is the same. Problem 27 on the following day repeats Problem 21 verbatim. The repetition is useful evidence that this was a persistent workshop theme rather than three unrelated questions.

The completed analysis of Problem 15 (AIM-DYNAMICAL_SYSTEMS-0058) derived a global sequential Gordin recursion from summable transfer-cocycle memory. When do the local martingale-coboundary decompositions glue globally, and what precisely is paid at the seams?

O / open | AMR 问题清单汇编

Returning to stochastic attractors, observe that the existence of a parameter $c\in \mathbb{R}$ for which the quadratic map $x \mapsto x^2+c$ displays an absolutely continuous measure is easy to ensure. It suffices to pick a parameter c such that the post-critical orbit is finite but not periodic. In dimension 2, the existence of a positive measure set of parameters of H\'enon maps displaying an attractor supporting an invariant SRB measure (i.e., a measure whose conditional measures along unstable curves are absolutely continuous.) is a fundamental result, whose proof still remain difficult and lengthy ([BC,Berger,Ta,WY]).

Is there a quick proof for the existence of SRB for some parameters of the H\'enon maps?

Henon Maps: Open Problems - Question 23

O / open | AMR 问题清单汇编

Let us now suppose that f is a real surface automorphism. In other words, we suppose X to be projective and defined by real polynomial equations, and f to be also defined over the real numbers. We may thus consider the restriction map $f_\mathbb{R}$ to the set of real points $X_\mathbb{R}$. Observe that $h_{\mathrm top}(f_\mathbb{R})\le \log \lambda$. It was proved in [BS8] that for generalized H\'enon maps $h_{\mathrm top}(f_\mathbb{R})= \log \lambda$ implies f to be quasi-hyperbolic.

If f is a real surface automorphism such that the entropy of $f_\mathbb{R}$ is the same as the entropy of f, does it follow that f is quasi-hyperbolic?

Henon Maps: Open Problems - Question 27

O / open | AMR 问题清单汇编

Several articles attempt at giving lower bounds for topological entropy of real H\'enon maps, e.g., [NBGM,NP]. Among others, the paper [NBGM] rigorously showed that $h_{\mathrm{top}}(f_{c, b}|_{\mathbb{R}^2})>0.46469$ for the classical H\'enon's parameter, and this bound is believed to be close to optimal. For upper bounds, the paper [BLS] has shown that $h_{\mathrm{top}}(f_{c, b}|_{\mathbb{R}^2})<\log 2$ if and only if the Julia set of $f_{c, b}$ (as a complex dynamical system) is not contained in $\mathbb{R}^2$. However, there is no algorithm which provides rigorous (non-trivial) upper bounds.

We thus propose the following problem.

Construct an algorithm to compute a rigorous upper bound for the topological entropy of a real H\'enon map $f_{c, b}|_{\mathbb{R}^2}$.

It is unclear how to extend this construction to a larger class of polynomial automorphisms of $\mathbb{C}^3$. However when $\lambda(f)^2>\lambda(f^{-1})$ an invariant valuation on the ring of polynomial functions in three variables (One way to interpret geometrically such an object is to say that it picks an irreducible subvariety in *any* algebraic compactification of $\mathbb{C}^3$ in a compatible way.) is known to exist by [DF20], which suggests the following question.

Let $f\in \mathrm{Aut}[\mathbb{C}^3]$ be any polynomial automorphism such that $\lambda(f)^2>\lambda(f^{-1})$. Prove the existence of a projective compactification X of $\mathbb{C}^3$ such that the induced birational map $f\colon X \dashrightarrow X$ admits a super-attracting fixed point p on the divisor at infinity.

12533 | AMR-152-0006

Henon Maps: Open Problems - Question 6

O / open | AMR 问题清单汇编

Under this assumption, and in restriction to any open topological disc $D\subset \mathbb{R}^2$ that is compactly mapped inside itself, the dynamics is semi-conjugated to a (non-trivial) continuous map of a real tree. Other strong consequences can be derived (e.g., a closing lemma, or a description of zero entropy dynamics, see below). Using Wiman's theorem (in the same spirit like in [DL, MR3213832]), one can prove that H\'enon maps are mildly dissipative once $|b|<1/4$. In this way we obtain dynamical informations for *all* H\'enon maps having their Jacobian in $(-1/4,1/4)$ and not only for those satisfying $|b|\ll 1$. One expects that this property extends beyond the bound obtained through Wiman's theorem.

Which real H\'enon maps $f_{c,b}$ are mildly dissipative? Is this property satisfied by all H\'enon maps with $|b|<1$?

Is there a deformation theory for arboreal Galois representations?

Consider x^2+t where $t^2=0$ over Artinian ring $K[t]/t^2$ or $K[t]/t^n$ for $n\geq 1$.

Can we parametrize arboreal Galois representations as we do p-adic Galois representations? This is different from the direction of the other remark.

Labeled subgroups of subshift full groups

O / open | AIM 研讨会问题汇编

Let \(\Omega\subseteq B^{\mathbb Z}\) be a two-sided subshift with shift \(\sigma\), and let \(\{\delta_a:a\in A\}\) be a specified finite family in the topological full group \([[\sigma]]\). Study the subgroup \(H=\langle\delta_a:a\in A\rangle\).

That page gives Problem 2.4 no introduction, proposer, status, remarks, or bibliography. In particular, it does not define:

- the space or action whose topological full group is intended; - the alphabet or index set \(A\); - the homeomorphisms \(\delta_a\); or - the probability measure and convention meant by “Liouville property.”

The preceding Problem 2.2 on the same page defines a two-sided subshift \(\Omega\subseteq A^{\mathbb Z}\), the shift \(\sigma\), and its topological full group \(F(\Omega)\). It is plausible that Problem 2.4 was intended to inherit that setting, but the page contains no cross-reference. Problem 2.1 uses different named generators \(\varphi_a\), not \(\delta_a\), and gives no identification between them.

The official 2024 AIM workshop report has a section on the structure of topological full groups and reproduces Problems 2.1 and 2.2 as Questions 0.3 and 0.4. It then moves to the entropy problem as Question 0.5 and does not reproduce Problem 2.4. Therefore neither the official report nor the archived source recovers \(\delta_a\).

The literal prompt has no determinate truth value. The conservative reconstruction analyzed below is explicitly conditional:

The symbol \(B\) is used for the subshift alphabet and \(A\) only for generator labels, since the source does not establish that they coincide.

Local Discrete Holomorphic Dynamics - Open Problem OP1

O / open | AMR 问题清单汇编

\emph{Find families $\{f_{\lambda, a}(z)=\lambda z+z^2 g_a(z)\}_{a\in M}\subset\mathop\mathrm{End}\nolimits(\mathbb{C},O)$ of elliptic discrete holomorphic dynamical systems such that $f_{\lambda,a}$ is holomorphically linearizable if and only if λ is a Brjuno number.} For instance, *is it true that an elliptic polynomial is holomorphically linearizable if and only if its multiplier is a Brjuno number?* Or, even more specifically, *is it true that an elliptic cubic polynomial is holomorphically linearizable if and only if its multiplier is a Brjuno number?*

In this context, it might be useful to remember the following dichotomy due to Ilyashenko and Perez-Marco:

\begin{theorem}[Ilyashenko, 1979 [I1], Perez-Marco, 2001 [P9]]

Given $g\in\mathop\mathrm{End}\nolimits(\mathbb{C},O)$ and $\lambda\in \mathbb{C}^*$ not a root of unity, put \[f_{\lambda,a}=\lambda z+azg(z) \] for all $a\in\mathbb{C}$. Then:

\mathrm{(i)} either the origin is a Siegel point of $f_{\lambda,a}$ for all $a\in\mathbb{C}$, or

\mathrm{(ii)} the origin is a Cremer point of $f_{\lambda,a}$ for all $a\in\mathbb{C}\setminus K$, where $K\subset\subset\mathbb{C}$ is a bounded exceptional set of capacity (and hence Lebesgue measure) zero.

\end{theorem}

Local Discrete Holomorphic Dynamics - Open Problem OP4

O / open | AMR 问题清单汇编

Give an effective procedure for deciding whether two germs tangent to the identity are holomorphically locally conjugated.

Clearly, a similar question can be asked for parabolic germs; in that case another (topological, formal and holomorphic) invariant is the multiplier, and one has to replace the multiplicity by a suitably defined parabolic multiplicity, and the index by a suitably defined parabolic index (or, better yet, by \'Ecalle's iterative residue). Then the multiplier and the parabolic multiplicity are a complete set of topological invariants, the multiplier, the parabolic multiplicity and the iterative residue are a complete set of formal invariants, and adding suitably adjusted \'Ecalle-Voronin functional invariants one obtains a complete set of holomorphic invariants. Again, most of the times the computation of the functional invariants is hopeless, and thus we have the following generalization of the previous question:

背景链接：https://arxiv.org/abs/1107.4876

12600 | AMR-141-0010

Local Discrete Holomorphic Dynamics - Open Problem OP5

O / open | AMR 问题清单汇编

\emph{Let $f\in\mathop\mathrm{End}\nolimits(\mathbb{C}^n,O)$ be non-invertible and dominant. Is it true that $c_\infty=c_\infty(f)$ is an algebraic integer of order at most n, i.e., there are integers $a_0,\ldots, a_{n-1}\in\mathbb{Z}$ such that $c^n_\infty+a_{k-1} c_\infty^{k-1}+\cdots+a_0=0$? Moreover, does there exist $\delta\in(0, 1]$ such that $\delta c^k_\infty\le c(f^k)\le c^k_\infty$ for all $k\ge 1$?}

Roughly speaking, the order of a germ may be thought of as a sort of analog of the degree of a polynomial map: the former somewhat measure the rate of attraction of the origin, while the latter measure the rate of attraction of infinity. For the sequence of the degree of the iterates of a polynomial map, Favre and Jonsson [FJ2] have proved the following

\begin{theorem}[Favre-Jonsson, 2011 [FJ2]]

Let $F\colon\mathbb{C}^2\to\mathbb{C}^2$ be a polynomial map. Then the sequence $\{\deg F^j\}_{j\in\mathbb{N}}$ satisfies a linear recursion formula with integer coefficients. \end{theorem}

We can then wonder whether a similar property holds for the sequence of orders of the iterates of a germ:

12603 | AMR-141-0013

Local Discrete Holomorphic Dynamics - Open Problem OP9

O / open | AMR 问题清单汇编

\emph{Let f, $g\in\mathop\mathrm{End}\nolimits(\mathbb{C}^n,O)$ be two superattracting germs, with $c(f)=c(g)$. Is it true that f and g are topologically (respectively, holomorphically) locally conjugated if and only if their postcritical sets are topologically (respectively, holomorphically) conjugated, that is, there is a local homeomorphism (respectively, biholomorphism) sending the postcritical set of f onto the postcritical set of g?}

Concerning instead the classification problem with respect to the formal conjugacy, [AR] contains a formal classification of superattracting germs $f\in\mathop\mathrm{End}\nolimits(\mathbb{C}^2,O)$ of order 2. The methods given there can in principle be used to attack the general formal classification problem; here we limit ourselves to a more specific question:

What is the topological structure of (the germ at p of) K_f?

For instance, does K_f have non-empty interior? Is it locally connected at p? Is $K_f\setminus\{p\}$ connected? What is the topological (homological, cohomological) structure of $U\setminus K_f$? And so on.

\begin{remark} Both the definition of stable set and Question 1 are topological in character; we might also state them for local dynamical systems which are continuous only. However, the *answers* might (and usually will) strongly depend on the holomorphicity of the dynamical system. \end{remark}

Clearly, the stable set K_f is completely f-invariant, and thus the pair (K_f,f) is the promised discrete global dynamical system, canonically associated with the given discrete local dynamical system. In particular, the second natural question in discrete holomorphic local dynamics is

背景链接：https://arxiv.org/abs/1107.4876

12605 | AMR-141-0002

Local Discrete Holomorphic Dynamics - Open Problem Q2

O / open | AMR 问题清单汇编

What is the dynamical structure of (K_f,f)?

For instance, what is the asymptotic behavior of the orbits? Do they converge to p, or have they a chaotic behavior? Is there a dense orbit? Do there exist proper f-invariant subsets, that is sets $L\subset K_f$ such that $f(L)\subseteq L$? If they do exist, what is the dynamics on them?

To answer all these questions, one of the most efficient ways is to replace f by a dynamically equivalent but simpler (e.g., linear) system g. In our context, ``dynamically equivalent" means ``locally conjugated"; and we have different kinds of conjugacy to consider.

\begin{definition} Let $f_1\colon U_1\to M_1$ and $f_2\colon U_2\to M_2$ be two holomorphic local dynamical systems at $p_1\in M_1$ and $p_2\in M_2$ respectively. We shall say that f_1 and f_2 are *holomorphically* (respectively, *smoothly,* C^k with $k\in\mathbb{N}^*$, or *topologically*) *locally conjugated* if there are open neighbourhoods $W_1\subseteq U_1$ of p_1, $W_2\subseteq U_2$ of p_2, and a biholomorphism (respectively, a C^∞ diffeomorphism, a C^k diffeomorphism, or a homeomorphism) $\varphi\colon W_1\to W_2$ with $\varphi(p_1)=p_2$ such that $$ f_1=\varphi^{-1}\circ f_2\circ\varphi $$ on $\varphi^{-1}\bigl(W_2\cap f_2^{-1}(W_2)\bigr)=W_1\cap f_1^{-1}(W_1)$. \end{definition}

If $f_1\colon U_1\to M_1$ and $f_2\colon U_2\to M_2$ are locally conjugated we clearly have $$ K_{f_2|_{W_2}}=\varphi(K_{f_1|_{W_1}})\;; $$ so the local dynamics of f_1 about p_1 is to all purposes equivalent (up to the order of smoothness of the local conjugation) to the local dynamics of f_2 about p_2.

In particular, using local coordinates centered at $p\in M$ it is easy to show that any holomorphic local dynamical system at p is holomorphically locally conjugated to a holomorphic local dynamical system at $O\in\mathbb{C}^n$, where $n=\dim M$; so from now on we shall mostly work only with $\mathop\mathrm{End}\nolimits(\mathbb{C}^n,O)$.

Whenever we have an equivalence relation in a class of objects, classification problems come out. So the third natural question in local holomorphic dynamics is

背景链接：https://arxiv.org/abs/1107.4876

12606 | AMR-141-0003

Local Discrete Holomorphic Dynamics - Open Problem Q3

O / open | AMR 问题清单汇编

\emph{Find a (possibly small) class $\mathcal{F}$ of holomorphic local dynamical systems at $O\in\mathbb{C}^n$ such that every holomorphic local dynamical system f at a point in an n-dimensional complex manifold is holomorphically (respectively, smoothly, C^k, or topologically) locally conjugated to a (possibly) unique element of $\mathcal{F}$, called *holomorphic* (respectively, *smooth,* C^k or *topological*) *normal form* of f.}

Unfortunately, the holomorphic classification is often too complicated to be practical; the family $\mathcal{F}$ of normal forms might be uncountable. A possible replacement is looking for invariants instead of normal forms:

背景链接：https://arxiv.org/abs/1107.4876

12607 | AMR-141-0004

Local Discrete Holomorphic Dynamics - Open Problem Q4

O / open | AMR 问题清单汇编

\emph{Find a way to associate a (possibly small) class of (possibly computable) objects, called *invariants,* to any holomorphic local dynamical system f at $O\in\mathbb{C}^n$ so that two holomorphic local dynamical systems at O can be holomorphically (respectively, smoothly, C^k, or topologically) locally conjugated only if they have the same invariants. The class of invariants is *complete* if two holomorphic local dynamical systems at O are holomorphically (respectively, smoothly, C^k, or topologically) locally conjugated if and only if they have the same invariants.}

Contrarily to the previous ones, our final general question makes sense only for *holomorphic* local dynamical systems. Indeed, a discrete holomorphic local dynamical system at $O\in\mathbb{C}^n$ is given by an element of $\mathbb{C}_0\{z_1,\ldots,z_n\}^n$, the space of n-tuples of converging power series in $z_1,\ldots,z_n$ without constant terms, which is a subspace of the space $\mathbb{C}_0[\![z_1,\ldots,z_n]\!]^n$ of n-tuples of formal power series without constant terms. It is well known that $\mathbb{C}_0[\![z_1,\ldots,z_n]\!]^n$ is closed under composition of power series, and that an element $\Phi\in \mathbb{C}_0[\![z_1,\ldots,z_n]\!]^n$ has an inverse (with respect to composition) still belonging to $\mathbb{C}_0[\![z_1,\ldots,z_n]\!]^n$ if and only if its linear part is a linear automorphism of $\mathbb{C}^n$.

\begin{definition} We say that f_1, $f_2\in\mathbb{C}_0[\ negthinspace[z_1,\ldots,z_n]\negthinspace]^n$ are *formally conjugated* if there is an invertible $\Phi\in\mathbb{C}_0[\![z_1,\ldots,z_n]\!]^n$ such that $f_1=\Phi^{-1}\circ f_2\circ\Phi$ in $\mathbb{C}_0[\![z_1,\ldots,z_n]\!]^n$. \end{definition}

Clearly, two holomorphically locally conjugated holomorphic local dynamical systems are both formally and topologically locally conjugated too. On the other hand, there are examples of holomorphic local dynamical systems that are topologically locally conjugated without being neither formally nor holomorphically locally conjugated, and examples of holomorphic local dynamical systems that are formally conjugated without being neither holomorphically nor topologically locally conjugated. So the last natural general question in local holomorphic dynamics is

We collect some of the natural questions that one might ask about the moduli spaces $\mathcal{M}_d^N$ and about automorphism groups. \begin{parts}

(a) For $N\ge2$, are all \textup(some, none\textup) of the moduli spaces $\mathcal{M}_d^N$ rational varieties?

(b) For each (N,d), describe the possible groups $\operatorname{Aut}(f)$ for $f\in\mathcal{M}_d^N$, or at least give a good upper bound for \[U(N,d):=\sup_{f\in\mathcal{M}_d^N}\#\operatorname{Aut}(f) \] in terms of N and d. It is known that $U(N,d)$ is finite [MR2741188], that $U(1,d)\le\max\{60,2d+2\}$ [MR2884382, Example 2.54], and that $U(2,d)\le60d^6$ [arxiv1509.06670, Theorem 6.2].

(c) Describe the subvarieties of $\mathcal{M}_d^N$ corresponding to maps f whose automorphism group $\operatorname{Aut}(f)$ is non-trivial. See [MR3709645] for a detailed analysis for $N=1$ and [arxiv1607.05772] for some partial results for $N=d=2$. For example, \[\{f\in\mathcal{M}_2^1\cong\mathbb{A}^2:\operatorname{Aut}(f)\ne1\}=\text{cuspidal cubic curve in $\mathbb{A}^2$,} \] with $\operatorname{Aut}(f)\cong\mathbb{Z}/2\mathbb{Z}$ except for the map f at the cusp, for which $\operatorname{Aut}(f)\cong{\mathcal{S}}_3$.

(d) Most of the spaces $\mathcal{M}_d^N$ are singular. Describe the singularity locus. The case $N=1$ is analyzed in [MR3709645]. \end{parts}

It is known that $\overline\mu_d(\mathbb{P}^N)\le d^{-(N-1)}$ for all $N\ge2$ and all $d\ge2$; see [arxiv0908.3835, Proposition 10] and [MR2975153]. This leads to the obvious question.

What is the exact value of $\overline\mu_d(\mathbb{P}^N)$?

Open Problems in Arithmetic Dynamics - Question 38 (Vague Motivating Question)

O / open | AMR 问题清单汇编

If we let f range over $\operatorname{End}_{\mathsf{Set}}(S)$ or $\operatorname{Aut}_{\mathsf{Set}}(S)$ and let $\#S\to\infty$, then there are known statistics for $\#\operatorname{Per}(f,S)$ and for various natural quantities associated to the graph Γ_f such as its number of components, its largest component, its largest cycle, and many others. See for example [MR1083961,MR0119227,MR0062973]. In particular, Flajolet and Odlyzko [MR1083961] analyze a large number of properties for average random maps, and one may ask whether similar statistics hold if one restricts to maps defined by polynomials.

To what extent do polynomial maps behave like random set maps?

Describe the symplectic invariants of stable rank-one singularities described by V. V. Kalashnikov. For such singularities, one of the action variables, say I_1, is smooth, and the other I_2 is singular. Is it true that I_1 and I_2 are sufficient for the symplectic classification? Here is an almost equivalent version of this question. Assume that we have two functions H and F that commute with respect to two different symplectic structures ω_1 and ω_2 and define (in both cases) a stable rank-one singularity described by V. V. Kalashnikov. Assume that the action variables I_1 and I_2 are the same for ω_1 and ω_2. This condition is equivalent to the relation $$ \oint_\gamma \alpha_1 = \oint_\gamma \alpha_2 $$ for any cycle γ on any regular fiber $\mathcal L_{f,h}=\{ F=f, H=h\}$ and appropriately chosen 1-forms α_i such that $d\alpha_i = \omega_i$, $i=1,2$. Is it true that, under these conditions, there exists a smooth map ψ that preserves the functions F and H and such that $\psi^*(\omega_2)=\omega_1$? The source notes that the simplest case is known.

Assume that we know explicit formulas for the action variables $I_1,\dots, I_n$ so that we are able to analyse their asymptotic behaviour in a neighbourhood of a singular fiber. Can we recover the topology of this singularity from the asymptotic behaviour (or at least to distinguish between different types of singularities)? For example, we know that, in the case of non-degenerate hyperbolic singularities, the singular part I_{sing} is of the form $h\ln h + \dots$. Is this property characteristic for non-degenerate hyperbolic singularities? The case of one degree of freedom is understood in .

12832 | AIM-DYNAMICAL_SYSTEMS-0090

PCF descent, higher-dimensional sparsity, and a finite-stratum certificate

P / partially_solved | AIM 研讨会问题汇编

PCF if the orbit of the ramification locus \(C\), \(V=\bigcup_{n\geq0}f^n(C)\), is a proper algebraic subvariety; “PCF all the way down” if the restriction of \(f\) to every periodic component of the post-critical component \(V\) is PCF.

It asks, for a morphism \[f:\mathbb P^N\longrightarrow\mathbb P^N, \] whether ordinary PCF implies “PCF all the way down,” whether either class is Zariski dense in \(M_d^N\), and whether there is a less restrictive notion that is abundant, dense in a reasonable topology, and has an André-Oort property. The two definitions in the record are:

The live source page, http://aimpl.org/finitedynamics/5/, was checked on 2 August 2026. On the live page the latter is a broken link to `#it1`; it probably means definition (1), but this cannot be recovered with certainty and is not silently corrected here.

Three conventions are needed to make the question precise.

1. Work over \(\mathbb C\), take \(d\geq2\), and use reduced supports. Write \[P(f)=\overline{\bigcup_{n\geq1}f^n(\operatorname{Crit}(f))}^{\rm Zar}. \] Including \(\operatorname{Crit}(f)\) itself, as the source does in \(V\), does not change whether its orbit is contained in a proper algebraic set. 2. A periodic component means an irreducible component \(L\) with \(f^r(L)=L\) set-theoretically for some \(r>0\). If components form a cycle, the relevant map is the first return \(f^r|_L\), not \(f|_L\). 3. The source definition is one-step. Astorg's later definition is recursive: take the union of periodic irreducible components, pass to a common return iterate, take its intrinsic postcritical set, and repeat. “All the way down” below refers to this modern recursive version; the literal source version follows already at the first step.

If a periodic component is singular, “ramification locus of the restriction” has no automatic smooth-manifold meaning. This is a real mathematical obstruction, not merely notation; Sections 8 and 9 explain it.

Periodic rational difference equations

O / open | AMR 问题清单汇编

Consider $$x_{n+k}=\frac{A_0+A_1x_n+\cdots+A_kx_{n+k-1}}{B_0+B_1x_n+\cdots+B_kx_{n+k-1}},$$ where the coefficients are nonnegative, $\sum A_i,\sum B_i>0$, and $A_1^2+B_1^2\ne0$. Call it p-periodic if every positive initial condition generates a sequence of least common period p. Apart from rescaling and index-dilation equivalents of $$x_{n+1}=x_n,\quad x_{n+1}=1/x_n,\quad x_{n+2}=x_{n+1}/x_n,\quad x_{n+2}=(1+x_{n+1})/x_n,$$ and $$x_{n+3}=(1+x_{n+1}+x_{n+2})/x_n,$$ are there any such periodic equations?

Power twists obstruct arithmetic reconstruction from the preperiodic-point field

P / partially_solved | AIM 研讨会问题汇编

What do you need to know about \(K_f\) to figure out what \(f\) was (or how close to \(f\) can you get)?

The archived AIM page supplies the missing definition verbatim: for a number field \(K\) and \(f(z)\in K(z)\) of degree at least two, \[K_f=K(\text{all preperiodic points of }f). \] The next AIM item separately introduces \(K_f'=K(\text{all periodic points of }f)\), confirming that \(K_f\) in this problem means the field generated by **preperiodic**, not merely periodic, points. The official workshop summary likewise distinguishes dynatomic fields generated by periodic points from arboreal fields generated by backward orbits, but it does not discuss Problem 7.2 specifically.

There is a second ambiguity: “conjugate” may mean conjugate by \(\operatorname{PGL}_2(K)\) or by \(\operatorname{PGL}_2(\overline K)\). The distinction is essential below. The neighboring Problem 7.1 explicitly suggests the equivalence types “conjugate, an iterate, or conjugate to something that commutes,” and asks only for commensurability of \(K_f\) and \(K_g\). We therefore analyze exact equality and commensurability of embedded extensions, and distinguish arithmetic from geometric conjugacy.

Quantitative causal mollification and structural obstructions for state-dependent delay

P / partially_solved | AIM 研讨会问题汇编

This is record 1 from the AIM workshop *Low dimensional structures in dynamical systems with variable time lags* (June 2010). Its four subquestions, with line wrapping repaired but mathematical signs preserved, are:

1. **Existence and smoothness of local invariant manifolds at equilibria for neutral differential equations with state-dependent delay.** A particular class is \[x'(t)=A\bigl(x'(t-r(x(t)))\bigr)+f(x(t)), \] with a linear operator \(A\), a delay function \(r\), and a smooth nonlinearity \(f\). 2. **Extension of “lap-number” techniques to the widest possible class of equations with delay.** The PDF lists equations with non-monotonic delay, implicitly defined delay, and “multiple delay,” and suggests numerical case studies as input to analysis. 3. **How does a state-dependent delay change the dynamics in contrast to a constant delay?** Suggested test cases are scalar Wright or Mackey--Glass equations, scalar equations with two or more delays, and higher-order equations with one or more delays. 4. **Approximation of delay dependence** \[x(t+r(x(t))) \] **by distributed/integral terms to improve smoothness properties.**

12880 | AIM-DYNAMICAL_SYSTEMS-0015

Quantitative prime support in polynomial orbits

P / partially_solved | AIM 研讨会问题汇编

What is the growth rate of $N(x)$ for PCF and non PCF maps?

Assume $f(z)\in\mathbb Q[z]$ is PCF (orbit of critical points is finite) and some reasonable starting point $\alpha\in\mathbb Q$.

The definition of $N(x)$ is omitted from this record. The January 13, 2017 capture gives the section introduction

Problem 1.1 then defines

\[N(x)=\#\{p\le x:p\mid f^n(\alpha)\text{ for some }n\}. \]

Thus the intended setting is a polynomial $f\in\mathbb Q[z]$, a rational starting point α, and rational primes p. The page does not define “reasonable,” nor specify whether $n=0$ is included. We use $n\ge1$; including $n=0$ changes the count by finitely many primes unless $\alpha=0$, itself a degenerate case.

Write each nonzero orbit value in lowest terms as

\[f^n(\alpha)=A_n/B_n,\qquad A_n\in\mathbb Z,\quad B_n\in\mathbb Z_{>0},\quad \gcd(A_n,B_n)=1. \]

We interpret $p\mid f^n(\alpha)$ as $v_p(f^n(\alpha))>0$, equivalently $p\mid A_n$. Primes dividing coefficient or starting-point denominators may be put in a fixed exceptional set, changing $N(x)$ by $O_{f,\alpha}(1)$. A polynomial is postcritically finite (PCF) when every critical point has finite forward orbit.

The source ambiguity is mathematically important: without nondegeneracy conditions on α, neither the PCF nor the non-PCF class has one growth rate.

来源字段：http://aimpl.org/galarithdyn/1/

12881 | AIM-DYNAMICAL_SYSTEMS-0030

Quantitative root-degree obstructions for preimage extensions

P / partially_solved | AIM 研讨会问题汇编

“The previous section's problem appropriately phrased for preimage extensions.”

It is problem 8.1 in the section “Arboreal side” of the 2016 AIM workshop *The Galois theory of orbits in arithmetic dynamics*.

The fragment does not specify a map, a root, the tree, or the comparison group. The workshop report makes the intended arboreal reading substantially clearer. Tucker considers a number field K, a polynomial f, the inverse limit G of the Galois groups of the splitting fields of $f^n(x)$, and the inverse limit G' for $f^n(x)-t$ over $K(t)$; he asks, under the assumption that 0 is not periodic, for an example in which G has infinite index in G'. Jones's contribution to the same report asks for classes of higher-degree maps for which finite index in the preimage-tree automorphism group should fail.

Accordingly, the following is the **reconstructed question** used here.

Let K be a number field, let $f\in K(z)$ have degree $d\geq2$, and let $\alpha\in\mathbb P^1(K)$. Assume that α is not in the postcritical set of f, so that the level-labelled preimage tree \[T(f,\alpha)=\coprod_{n\geq0}f^{-n}(\alpha) \] is a regular rooted d-ary tree. Put \[K_n=K\bigl(f^{-n}(\alpha)\bigr),\qquad G_n=\operatorname{Gal}(K_n/K),\qquad G_\infty=\varprojlim G_n. \] Let E_n be the arithmetic generic monodromy group of $f^n(x)-t$ over $K(t)$, and $E_\infty=\varprojlim E_n$. After choosing a compatible specialization embedding, $G_\infty\subseteq E_\infty\subseteq\operatorname{Aut}(T_d)$. Classify pairs (f,α) for which \[[E_\infty:G_\infty]=\infty. \tag{1.1} \] When $E_\infty=\operatorname{Aut}(T_d)$, this is the usual full-tree finite-index problem. When critical relations or symmetries force E_∞ to be smaller, E_∞ (or a still smaller subgroup encoding root-dependent structure) is “the thing it is supposed to” be.

There remains genuine reconstruction uncertainty. The short AIM text may have intended only polynomials rooted at 0, as in Tucker's formulation, or the now-standard pair (f,α). It also does not say whether the expected group is always $\operatorname{Aut}(T_d)$ or the generic monodromy group of the fixed map. Both readings are kept explicit below.

Quenched CLTs, centering, and explicit tests for random expanding maps

P / partially_solved | AIM 研讨会问题汇编

Given an observable \(\phi:X\to\mathbb R\), can one show in the annealed dynamics that, for almost every \(P\in X\times\Omega\), the quenched system has a central limit theorem?

Its notation is

\[T_{\beta_i}:X\longrightarrow X,\qquad i=1,2,\qquad X=[0,1], \]

not an unsubscripted product \(T\beta i\). The source says that random compositions have a central limit theorem and then asks:

This wording is verified from page 1. It is mathematically ambiguous in several ways.

- The capital \(P\in X\times\Omega\) appears to denote a point, not a probability. We reserve \(\mathbb P\) for the law on environments. - An annealed CLT is a statement under a joint law on \(X\times\Omega\). A quenched CLT fixes \(\omega\) and takes distribution only over \(x\) under a fiber measure. It is therefore normally asserted for \(\mathbb P\)-almost every environment, not for almost every fixed \(x\). - No map-selection law, stationary measure, centering, normalization, observable class, or uniform expansion/mixing hypothesis is specified. - A statement for almost every point \((x,\omega)\) would more naturally be an almost-sure CLT, which is different from an ordinary quenched CLT.

Nearby context matters. Page 2 contains Problem 14: “Quenched central limit theorem (CTL): Are the normalizing constants and variance almost surely the same?” This confirms that equality of centering and variance between annealed and quenched laws was an intended issue.

The controlled reconstruction used below is: \(\Omega=\{1,2\}^{\mathbb Z}\) has a stationary ergodic law \(\mathbb P\), \(\sigma\) is the shift, and \(T_\omega=T_{\beta_{\omega_0}}\). The one-sided iid model in the question is obtained by projection; the two-sided natural extension is used when invertibility of the base is convenient.

Reachable points on lines through a unitary pair

O / open | AMR 问题清单汇编

Unfold a billiard trajectory in a regular n-gon by reflecting the polygon across each encountered side. A short trajectory joins two vertices and meets no vertex in between; a reachable point is an endpoint vertex occurring in such an unfolding. For an oriented short trajectory, let α and β be its source and target endpoint angles as in Definition 2.1 of the source, and write A_k for the resulting one of $n-2$ trajectory types (indices modulo $n-2$); in particular A_0 is characterized by $\beta-\alpha=2\pi/n$. For $n\ge5$, call reachable points u,v of type A_0 a unitary pair if $\det(u,v)=\sin((n-2)\pi/n)$, and put $\lambda=2\cos(\pi/n)$. Prove: (a) $u_m=u+m(\lambda+1)v$ is reachable of type A_0 for every integer m for which it lies in the upper half-plane; (b) $w_m=u+(\lambda+m(\lambda+1))v$ is reachable of type A_1 whenever it lies there; (c) there are no other reachable points on $u+\mathbb Rv$; and (d) the analogous description on $v+\mathbb Ru$ yields only types A_0 and A_{n-3}.

Scalar no-loss homogenization rate transfer and a multidimensional area obstruction

P / partially_solved | AIM 研讨会问题汇编

\[\dot x_\varepsilon=a(x_\varepsilon,y_\varepsilon) +\varepsilon^{-1}b(x_\varepsilon)v(y_\varepsilon), \qquad \dot y_\varepsilon=\varepsilon^{-2}g(y_\varepsilon), \qquad \int v(y)\,d\mu(y)=0. \]

It then asks, assuming decay of multiple correlations at a specified rate for the invariant measure \(\mu\), whether one can show

\[x_\varepsilon\longrightarrow_w X, \qquad dX=a(X)\,dt+b(X)*d\omega . \]

Here \(\longrightarrow_w\) is weak convergence; this repair is also corroborated by later papers treating exactly this fast--slow scaling. Three mathematical ambiguities remain in the printed question:

1. the topology of weak convergence is not stated; 2. the covariance of \(\omega\) and the meaning of the star integral are not stated; 3. because the original drift is \(a(x,y)\), the limiting \(a(x)\) must mean the \(\mu\)-average unless \(a\) is independent of \(y\).

The natural topology below is the uniform topology on \(C([0,T])\).

A 4/9 quadratic upper bound for the first Brown--Erdos--Sos case

P / partially_solved | AIM 研讨会问题汇编

For any $r\geq 3$ and $s\geq 4$ we have $$ f^r(n,s(r-2)+3,s)=o(n^2). $$

To remove a convention ambiguity, throughout this report $$ f_r(n,v,e)=\max\{|E(H)|:H\text{ is a simple }r\text{-uniform hypergraph on }n\text{ vertices and no }e\text{ distinct edges have union of size }\leq v\}. $$ For $n\geq v$, this is equivalently the largest number of edges in an r-graph in which every v-vertex set spans at most $e-1$ edges. Some sources write $f^{(r)}(n;v,e)$, and the original Sárközy--Selkow paper defines the least edge number which forces the configuration; the latter differs from the extremal maximum by one. Neither distinction changes an $o(n^2)$ assertion. Thus the AIM conjecture is $$ f_r(n,e(r-2)+3,e)=o(n^2) \tag{BES} $$ for each fixed $r\geq3$ and $e\geq4$.

There is a substantive transcription error in the first AIM remark. The cited Sárközy--Selkow theorem is $$ f_r\bigl(n,e(r-2)+2+\lfloor\log_2e\rfloor,e\bigr)=o(n^2), \tag{1} $$ not the displayed formula in the record, which omits the $+2$. This is confirmed both by the primary paper and by later papers quoting it. For $(r,e)=(3,4)$, (1) gives $f_3(n,8,4)=o(n^2)$, leaving $f_3(n,7,4)$ open, exactly as the next sentence of the AIM record says. The uncorrected formula would instead assert $f_3(n,6,4)=o(n^2)$, which is false: Glock, Joos, Kim, Kühn, Lichev and Pikhurko proved $$ f_3(n,6,4)=\left(\frac7{36}+o(1)\right)n^2. $$ This report preserves the source statement and corrects only the cited remark.

The second AIM remark also makes the roles of its parameters difficult to parse. A precise repeated-edge version is defined in Section 3 below.

13019 | AIM-COMBINATORICS-0105

A boundary-flux reduction for the mean square-grid sandpile identity

P / partially_solved | AIM 研讨会问题汇编

Jeremy Martin: “What is the average value of the scaling limit of the identity element of the sandpile group on $\mathbb Z^2$?”

The AIM record asks:

Wesley Pegden adds that an explicit construction for the square lattice might compute both that average and the side length of the central square of constant height 2, but that this was not then known.

Taken literally, there is no finite sandpile group “on $\mathbb Z^2$” with a distinguished recurrent identity. The standard reading, confirmed by the cited pictures and subsequent literature, is the following finite-volume problem. Let

$$ Q_L=\{1,\ldots,L\}^2\subset\mathbb Z^2 $$

and wire every edge leaving Q_L to one sink. Thus every nonsink vertex retains lattice degree four. Let $e_L:Q_L\to\{0,1,2,3\}$ be the recurrent representative of zero in the sandpile group. Rescale Q_L to the unit square and ask for

$$ A=\lim_{L\to\infty}A_L, \qquad A_L:=\frac1{L^2}\sum_{x\in Q_L}e_L(x). $$

This reconstruction matters. A $1,2,3,4$ height convention adds exactly 1 to the answer. Changing the exhaustion, aspect ratio, or dissipation rule changes the identities and may change the limit. Even and odd squares also have visibly different central sets (an odd square has a thin central cross), although that cross has vanishing area.

A d-dimensional permutation of order n is an n-by-n-by

P / partially_solved | AMR 问题清单汇编

Linal/Luria: A d-dimensional permutation of order n is an n-by-n-by-...-by-n (d+1)-dimensional array of zeroes and ones, with the property that every row, column, etc., has exactly one 1 in it. (More precisely, if the array entries are A(j_(1)j_(2)j_(3)...j_(d+1)), for each k in [d+1] and t in [n], there is exactly one choice of all coordinates j_(i) except i=k so that setting j_(i)=k makes A(j_(1)j_(2)j_(3)...j_(d+1))=1.) Let P(n,d) be the number of d-dimensional permutations of order n. Linial and Luria showed that P(n,d) < ((1+o(1))n/e^(d))^n^(d). Is this tight, i.e., is P(n,d) > ((1+o(1))n/e^(d))^n^(d)also true? If so, this would be a very satisfying generalization of Stirling's formula and well-known bounds on the number of Latin squares (which are 2-dimensional permutations in disguise). See this.

13031 | AIM-COMBINATORICS-0067

A defect-graph certificate for large crossing families

P / partially_solved | AIM 研讨会问题汇编

If K_n is drawn in the plane with straight line edges, can we always find $\Omega(n)$ pairwise crossing edges?

The record also cites the then-known $\Omega(\sqrt n)$ result of Aronov, Erdős, Kleitman, Pach, and collaborators, and a polynomial result for curves with bounded pairwise intersection multiplicity.

The standard precise reading is as follows. Let P be a set of n points in the plane in general position (no three collinear), and draw every edge of the complete graph as the straight segment between its endpoints. Two edges cross when their relative interiors intersect. A crossing family is a set of edges every two of which cross. Endpoint contacts therefore do not count: the edges in a crossing family have pairwise disjoint endpoints, so its size is at most $\lfloor n/2\rfloor$. Interior crossings of three or more edges at the same point are allowed by this definition. Write $$ T(P)=\max\{|\mathcal F|:\mathcal F\text{ is a crossing family spanned by }P\}, \qquad T(n)=\min_{|P|=n}T(P). $$ The recovered question is whether $T(n)=\Omega(n)$.

来源字段：https://www.overleaf.com/read/mnvcscjjysvg

13032 | AIM-COMBINATORICS-0108

A degree and orientation obstruction for a higher Merino theorem

P / partially_solved | AIM 研讨会问题汇编

Caroline Klivans: “How can we extend to higher dimensions Merino's result [25] that the generating function of the critical configurations (by degrees) is equal to an evaluation of the Tutte polynomial of G (in particular, is equal to $T(1,y)$))?”

David Perkinson asks whether there is a corresponding external-activity statistic. Klivans observes that the cellular matroid is available but that higher critical groups are counted by a torsion-weighted sum of spanning trees, suggesting an arithmetic rather than ordinary Tutte polynomial. Igor Pak suggests that degree might be constant on each Laplacian coset, permitting a formal generating function without first choosing critical representatives.

Reference [25] in the workshop list is Criel Merino López, *Chip firing and the Tutte polynomial* (1997). With a connected undirected graph $G=(V,E)$, sink q, and recurrent stable configurations c on $V\setminus\{q\}$, the normalization is

$$ \operatorname{level}_G(c) =\sum_{v\ne q}c(v)-|E|+\deg_G(q), \qquad T_G(1,y)=\sum_{c\in\operatorname{Rec}(G,q)}y^{\operatorname{level}_G(c)}. \tag{1.1} $$

This is a statistic of the distinguished recurrent representative of a reduced-Laplacian coset. It is not the value of an integer homomorphism on the sandpile group.

The higher-dimensional setting intended by the workshop is that of Duval--Klivans--Martin. For a finite simplicial complex X, their i-critical group is

$$ K_i(X)=\ker \partial_i/\operatorname{im}(\partial_{i+1}\partial_{i+1}^{*}). \tag{1.2} $$

Under their acyclicity and torsion-free-root hypotheses it is finite, is a cokernel of a reduced up-down Laplacian, and its order is a spanning-tree sum weighted by squared torsion.

A downgrade criterion for clique-order monotonicity

P / partially_solved | AIM 研讨会问题汇编

Let \(G\xrightarrow r K_k\) be minimal, i.e. \(G-e\not\xrightarrow r K_3\) for any \(e\in E(G)\).

The displayed source text contains

The occurrence of \(K_3\) is an internal typo: the parameter that follows varies with \(k\), and the standard definition in Fox--Grinshpun--Liebenau--Person--Szabó is minimality for \(K_k\). The unambiguous recovered statement is therefore as follows.

For integers \(r\geq 2\) and \(k\geq 3\), write \[G\longrightarrow (K_k)_r \] if every \(r\)-edge-colouring of \(G\) contains a monochromatic \(K_k\). Let \(\mathcal M_r(K_k)\) be the family of graphs that are \(r\)-Ramsey-minimal for \(K_k\): \[G\longrightarrow(K_k)_r, \qquad G-e\not\longrightarrow(K_k)_r\quad(e\in E(G)). \] Because the Ramsey property is monotone under taking supergraphs, minimality under every one-edge deletion is equivalent to having no proper Ramsey subgraph. Define \[s_r(K_k)=\min\{\delta(G):G\in\mathcal M_r(K_k)\}. \] The conjecture is \[\boxed{s_r(K_k)\leq s_r(K_{k+1})\quad\text{for all }r\geq2, k\geq3.} \] The workshop writes \(s_r(k)\) for \(s_r(K_k)\).

13039 | AIM-COMBINATORICS-0084

A finite certificate for three-stripe triangle avoidance

P / partially_solved | AIM 研讨会问题汇编

Conjecture. Let \(T\) be a set of three points in \(\mathbb E^2\). Then there exists a 3-coloring of \(\mathbb E^2\) with no monochromatic copy of \(T\).

The quantifiers intended by the source are \[\forall T\subset\mathbb E^2\ (|T|=3),\quad \exists c_T:\mathbb E^2\to\{0,1,2\},\quad \forall\text{ Euclidean isometries }g,\quad c_T\text{ is not constant on }g(T). \tag{1.1} \] Thus the coloring may depend on \(T\). This is an arbitrary point-coloring; no measurability or regularity is assumed. A “set of three points” has three distinct elements. Repeated-point multisets are therefore not intended.

The preceding record ends “For 3-point sets”, while the following record conjectures that two colors force every three-point configuration, with a possible equilateral exception. Graham and Tressler's published formulation says “for any triangle \(T\)” and identifies a triangle with its three vertices. We use the standard meaning of congruent copy: translation followed by an orthogonal map, including a reflection. This convention also agrees with the 2019 paper of Aichholzer and Perz, which explicitly includes the reflected triangle. The constructions below in fact handle reflections automatically.

This fixed-plane question must not be confused with the higher-dimensional Ramsey property. A nondegenerate triangle is a simplex and hence is Ramsey in some sufficiently high-dimensional Euclidean space for every fixed number of colors. Conjecture (1.1) instead asks whether three colors can avoid it when the ambient space is kept equal to \(\mathbb E^2\).

Acyclic orientations of a graph \(G\) are the regions of its graphic arrangement. The equivalence relation generated by converting a source into a sink encodes chip-firing on a special class of divisors, and its classes are represented geometrically by passing to the toric graphic arrangement. Is there a similar geometric model for chip-firing equivalence on larger classes of divisors? Can multi-toppling, or hereditary chip-firing, provide it, and when does that dynamics have the abelian property?

A four-point Hamming barrier in Euclidean Ramsey theory

P / partially_solved | AIM 研讨会问题汇编

Conjecture (\$1000). Every finite spherical set is Ramsey.

Its exact mathematical claim is:

Here a finite set \(X\subseteq\mathbb E^n\) is Ramsey if, for every positive integer \(r\), there is an \(N=N(X,r)\) such that every arbitrary \(r\)-coloring of all points of \(\mathbb E^N\) contains a monochromatic set congruent to \(X\). A set is spherical if all its points lie on one Euclidean sphere.

The source record ends with the fragment “A `warm up':”. This is not an additional hypothesis or an incomplete part of Conjecture 34. Graham's original published problem list confirms the intended prose: after the \(\$1000\) problem it says that, as a warm-up, one might prove that any four-point subset of a circle is Ramsey. Thus the warm-up belongs semantically to record 0082.

A congruent copy in \(\mathbb E^N\) is a distance-preserving image of the finite metric on \(X\). Equivalently, after restricting to \(\operatorname{aff}(X)\), it is the image under an affine isometric embedding \[x\longmapsto Ux+t, \] where \(U\) preserves inner products. Its affine subspace, orientation, and translation in \(\mathbb E^N\) are arbitrary; it is not required to lie in the standard copy of \(\mathbb E^n\). Reflections make no substantive difference (and can be extended to rotations after adding one unused dimension). Both pairwise distances and circumradius are preserved.

13047 | AIM-COMBINATORICS-0014

A holonomy reduction to equiangular lines

P / partially_solved | AIM 研讨会问题汇编

Given \(k\)-dimensional linear subspaces \(U,V\leq\mathbb R^d\), say that \(U,V\) are equi-isoclinic with angle \(\alpha\) if every unit vector in \(U\) projects onto \(V\) as a vector of length \(\alpha\).

Let \(N_\alpha^k(d)\) be the maximum number of \(k\)-dimensional subspaces of \(\mathbb R^d\), every pair of which is equi-isoclinic with angle \(\alpha\). Then \[\text{(1) }N_\alpha^k(d)=O_{\alpha,k}(d), \qquad \text{(2) }N_\alpha^k(d)=O_k(d)+o_{\alpha,k}(d). \]

The AIM record, problem 4.1 from the workshop *High-dimensional phenomena in discrete analysis*, states:

The word “angle” is potentially misleading. In the displayed definition, \(\alpha\) is the projection length, hence the cosine of every principal angle. The common principal angle itself is \[\theta=\arccos\alpha. \] Some papers instead call \(\lambda=\alpha^2\) the parameter of isoclinism. This report always uses the AIM convention: \(\alpha\) is the projection length.

The meaningful range is \(0\leq\alpha\leq1\), and the family is a set of distinct subspaces. Without distinctness, repetitions make the case \(\alpha=1\) unbounded. I assume \(d\geq k\).

Statement (2) needs a quantifier audit. Its nonredundant natural reading is: \[\exists C_k<\infty\ \ \forall\text{ fixed }\alpha\in(0,1)\ \exists r_{\alpha,k}(d)=o(d) \quad N_\alpha^k(d)\leq C_kd+r_{\alpha,k}(d). \tag{1.1} \] Thus the leading constant is independent of \(\alpha\), while the threshold and lower-order term may depend on \(\alpha,k\). If both terms were allowed unrestricted \(\alpha\)-dependence, (2) would say no more than (1).

13051 | AIM-COMBINATORICS-0285

A literal NP class for the P4-structure of proper 2-joins

P / partially_solved | AIM 研讨会问题汇编

Problem 1. Find a class \(\mathcal C_1\) of \(4\)-uniform hypergraphs such that

- the \(P_4\)-structure of every graph with a \(2\)-join belongs to \(\mathcal C_1\); - no odd ring belongs to \(\mathcal C_1\); - \(\mathcal C_1\) belongs to NP.

If \(G\) is a graph on \(V\), then its **\(P_4\)-structure** \[\mathsf P_4(G)=(V,\mathcal E_4(G)) \] is the \(4\)-uniform hypergraph whose hyperedges are precisely the four-element sets inducing a chordless four-vertex path in \(G\).

For odd \(k\geq5\), the **odd ring** \(\mathcal R_k\) has vertices \(u_0,\ldots,u_{k-1}\) and the \(k\) hyperedges \[\{u_{i+1},u_{i+2},u_{i+3},u_{i+4}\}, \qquad i\in\mathbb Z_k. \] Thus \(\mathcal R_k=\mathsf P_4(C_k)\).

The phrase “no odd ring belongs” is weaker than the phrase used immediately above it for the basic classes, namely “no \(4\)-uniform hypergraph in \(\mathcal C\) contains an induced odd ring.” This difference matters and is audited below.

The only explicit \(2\)-join definition in the source PDF appears in subsection F.4. This report follows that source convention. A split is \[(V_1,V_2;A_1,B_1,A_2,B_2), \] where \(V_1,V_2\) partition \(V(G)\), and \(A_i,B_i\) are disjoint nonempty subsets of \(V_i\). Across the split, all edges between \(A_1,A_2\), and all edges between \(B_1,B_2\), are present, and there are no other cross edges. For \(i=1,2\), let \(\mathcal P_i\) be the chordless paths in \(G[V_i]\) having one end in \(A_i\), the other in \(B_i\), and no internal vertex in \(A_i\cup B_i\). The source additionally requires \[\mathcal P_i\ne\varnothing \quad\text{and}\quad G[V_i]\text{ is not itself a path belonging to }\mathcal P_i. \tag{1.1} \] This is a connected, non-path, or “proper” \(2\)-join convention. The non-path condition is essential: if path \(2\)-joins are allowed, every sufficiently long odd hole has such a split, making the first two bullets inconsistent.

A merged record and the corrected balanced-circulant classification

O / open | AIM 研讨会问题汇编

CONJECTURE. Every non-empty balanced circulant is isomorphic to a \(G(k,m)\).

The first coherent problem in the record can nevertheless be recovered from the immediately preceding K.1 source text. For integers \(k,m\geq 1\), put \(n=4km\), take \(V=\mathbb Z_n\), and define \(G(k,m)\) by \[xy\in E(G(k,m)) \quad\Longleftrightarrow\quad x-y\equiv \pm1\pmod {4m}. \] Equivalently, the source writes \(x-y+4mt\equiv\pm1\pmod n\) for some integer \(t\). The conjecture appearing verbatim in this record is:

The preceding sentences also assert that the earlier decomposition conjecture holds for this family: when \(k>1\), \[S=\{0\}\cup\{4mi+1,4mi-1:1\leq i\leq k\} \] is a star cutset, while for \(k=1\) the graph is a basic \(4m\)-cycle.

First, it omits the definition of \(G(k,m)\), which occurs in the preceding record. Second, its claim that \(4mj\) is isolated in \(G[V\setminus S]\) for every \(1\leq j\leq k\) cannot include \(j=k\): modulo \(n\), \(4mk=0\), and vertex \(0\) belongs to \(S\). The correct range is \(1\leq j\leq k-1\).

13057 | AIM-COMBINATORICS-0189

A multigraph counterexample and a low-exposure reduction

S / solved | AIM 研讨会问题汇编

Conjecture 6.19 (Bermond--Thomassen). In a digraph D with $\delta_D^+\ge 2k-1$, there are k vertex-disjoint cycles.

Sullivan's report from the 2006 AIM workshop on the Caccetta--Haggkvist conjecture. After repairing only the PDF line breaks, its statement is

The source note says that the conjecture was open for $k\ge3$ and that Thomassen's proof for $k=2$ was not intuitive. 1 9”; no mathematical symbol is missing from the recovered sentence.

There is a consequential convention problem. At the start of the same report, a digraph is defined by vertex and edge sets with head and tail incidence relations, and the report explicitly says that this definition allows multiple edges from u to v. A *simple digraph* is then defined separately as having at most one such edge. Conjecture 6.19 says “digraph,” not “simple digraph.” Its definition of an edge as going from a vertex to “another vertex” excludes loops, but digons are not excluded. The report defines outdegree without saying whether parallel arcs are counted with multiplicity.

Under the usual incidence-counted degree of a directed multigraph, the exact printed statement is false. Under the alternative convention in which outdegree means the number of distinct out-neighbors, parallel copies can be deleted and the statement is exactly the standard simple-digraph conjecture. Both readings are treated below. The note about the known $k=2$ case and all modern formulations checked show that the latter was the intended problem.

13058 | AIM-COMBINATORICS-0019

A normalization counterexample for analytic-rank tensorization

P / partially_solved | AIM 研讨会问题汇编

The following is the `problem` field reproduced verbatim, including the printed symbol `\phi\neq S\subset[d]` and all original conventions:

The record's `literature` field says verbatim:

The exact statement needs the following reconstruction before it has a definite truth value.

1. The printed `\(\phi\neq S\subset[d]\)` is almost certainly an extraction/OCR error for the standard condition \(\varnothing\ne S\subsetneq[d]\). Both factors in a partition-rank-one decomposition must use nonempty complementary sets of modes. 2. \(\omega\) must be a **nontrivial** additive character, i.e. a primitive \(p\)-th root in the prime-field notation. If \(\omega=1\), every bias is one. 3. Standard analytic rank is \[\operatorname{arank}_p(T)=-\log_p\operatorname{bias}(T). \] The missing logarithm base matters critically when a numerical rank is raised to the \(m\)-th power. Base \(p\) is also the normalization for which matrix analytic rank equals matrix rank and Lovett's inequality \(\operatorname{arank}\le\operatorname{prank}\) has constant one. 4. The identity must be the order-\(d\), side-\(n\) diagonal tensor \[I_{n,d}=\sum_{i=1}^n e_i^*\otimes\cdots\otimes e_i^*. \] 5. Tensor power must mean the **Kronecker power**, denoted below by \(A^{\boxtimes m}\), which groups corresponding modes and has order \(d\) and side length \(n^m\). The ungrouped external tensor product has order \(dm\) and is a different operation. 6. The only nonvacuous quantification is: there exists \(c=c(A,p,d,n)\in(0,1)\), independent of \(m\), such that the inequality holds for every sufficiently large \(m\) (or, more strongly, every \(m\ge1\)). If \(c\) may depend on \(m\), the question does not express exponential amplification.

Under these standard choices, the analytic-rank branch of the displayed question is false. The partition-rank branch retains meaningful content in order at least four.

There is also a type distinction in the cap-set paragraph. The array \(C(x,y,z)\), indexed by group elements, is a coefficient tensor. Its analytic rank is the bias of its multilinear extension on three copies of \(\mathbb F_3^{3^k}\), not the average of \(\omega^{C(x,y,z)}\) over the three group indices.

13061 | AIM-COMBINATORICS-0236

A parity-enhanced shell inequality for the Erdős-Turán additive-basis problem

P / partially_solved | AIM 研讨会问题汇编

Suppose \(A\subseteq\mathbb N\) is an additive basis of order \(n\).

This is not a meaningful parameter in context. The same sentence then defines \(r(m)\) using pairs \((a_1,a_2)\), and the problem is explicitly attributed to Erdős and Turán. The intended order is therefore **2**. This is confirmed by the original conjecture and every primary modern restatement checked.

The recovered problem is:

Let \(A\subseteq\mathbb N_0=\{0,1,2,\ldots\}\) be an additive basis of order \(2\), so every sufficiently large integer belongs to \(A+A\). Define the ordered representation function

\[r_A(m)=\#\{(a_1,a_2)\in A^2:a_1+a_2=m\}. \]

\[\limsup_{m\to\infty}r_A(m)=\infty? \]

Some sources reserve “basis” for coverage of every nonnegative integer and “asymptotic basis” for eventual coverage. The result below applies to the eventual version. The choice \(\mathbb N=\mathbb N_0\) versus \(\{1,2,\ldots\}\), and any finite change to \(A\), do not affect whether the limsup is infinite.

A q-Eulerian last-site law for cycle IDLA

P / partially_solved | AIM 研讨会问题汇编

Problem (3), attributed to Persi Diaconis, asks about the “explorers game” of reference [16] on a cycle: repeatedly send an explorer from vertex \(0\), and study the vertex occupied last. It reports an Eulerian-number law and suggests studying higher-dimensional sets and circulant graphs. The recorded comments mention Jim Propp's earlier observation, possible connections with Pólya's and Bernard Friedman's urns, the difficulty of \(\mathbb Z^2\), and the possibility that weights in one dimension yield a new \(q\)-analogue. Footnote 2 merely points to a definition of Eulerian numbers; it is not an exponent.

Reference [16] is Diaconis and Fulton, *A growth model, a game, an algebra, Lagrange inversion, and characteristic classes*. Its explorer process is now usually called sequential internal diffusion-limited aggregation (IDLA):

1. initially the source \(0\) is occupied (equivalently, the first explorer starts with the empty aggregate and settles immediately at \(0\)); 2. each subsequent explorer is an independent copy of the specified Markov chain, started at \(0\); 3. it stops on first visiting an unoccupied vertex, which is then added to the aggregate.

This is not one random walk continued until its cover time.

There is an indexing inconsistency in the recorded cycle formula. With \(n\) vertices labelled \(0,\ldots,n-1\), vertex \(0\) is occupied first and cannot be last when \(n>1\). Direct derivation below gives \[\mathbb P(L=j) =\frac{\left\langle{\,n-1\atop j-1\,}\right\rangle}{(n-1)!}, \qquad 1\le j\le n-1, \] for simple symmetric walk, where the bracket is an ordinary Eulerian number. The PDF's \(A(n,j)/n!\) becomes correct after the corresponding one-unit change of cycle size and Eulerian index, for example on a cycle with \(n+1\) vertices with \(j\) replaced by \(j-1\). The discrepancy is consistent with the PDF's explicit warning that its quotations are informal summaries.

13066 | AIM-COMBINATORICS-0077

A reciprocity bound for long directed paths

P / partially_solved | AIM 研讨会问题汇编

Directed paths in Eulerian digraphs (Jacques Verstraete). Does every Eulerian digraph of average degree \(d\) have a directed path of length \(\Omega(d)\)? Getting \(\Omega(\sqrt d)\) is not too hard.

The record describes this as a special case of a conjecture of Bollobás and Scott associated with their paper *A Proof of a Conjecture of Bondy Concerning Paths in Weighted Digraphs*.

The conventions must be made explicit. In the modern literature on this problem, a digraph is finite, loopless, and simple: each ordered pair of distinct vertices supports at most one arc, though both opposite arcs may be present. A directed path is vertex-simple, and its length is its number of arcs. A digraph is Eulerian when \[d^+(v)=d^-(v)\qquad(v\in V(D)). \] Writing \(n=|V(D)|\) and \(m=|A(D)|\), the average degree in the question is the average out-degree \[d=\frac{m}{n}, \] not the average total degree \(2m/n\). These are the conventions explicitly used by Janzer--Sudakov--Tomon and Knierim--Larcher--Martinsson.

These conventions are logically necessary. If parallel arcs are allowed, two vertices with \(M\) arcs in each direction form an Eulerian multidigraph of average out-degree \(M\), while its longest vertex-simple directed path has length one. If “path” means a trail or walk, an Euler tour makes the connected case immediate. Thus neither of those readings is the intended problem.

Connectivity causes no difficulty. Every weak component of an Eulerian digraph is itself Eulerian, and every nontrivial weak component is strongly connected. Since the average degree of the whole digraph is the vertex-weighted average of the component averages, one component has average degree at least \(d\).

A saturated-list kernel for one-point extensions of four-color Ramsey colorings

P / partially_solved | AIM 研讨会问题汇编

Find \(r(3,3,3,3)\). Is it 51?

It records the historical bounds

\[51\le r(3,3,3,3)\le 62. \]

\[R_4(3):=r(3,3,3,3) \]

is the **least** integer \(N\) such that every coloring of \(E(K_N)\) with four colors contains a monochromatic triangle. I call a coloring with no monochromatic triangle **good**. With this convention:

- \(R_4(3)\ge51\) means that a good coloring of \(K_{50}\) exists. - \(R_4(3)\le62\) means that no good coloring of \(K_{62}\) exists. - The two statements do **not** assert that a good \(K_{51}\) or \(K_{61}\) exists. - The conjectural equality \(R_4(3)=51\) says precisely that 50 is the maximum possible order of a good four-coloring.

This off-by-one distinction is maintained throughout.

13071 | AIM-COMBINATORICS-0287

A scope trichotomy for the balanced-skew-partition class problem

P / partially_solved | AIM 研讨会问题汇编

Problem 3. Find a class \(\mathcal C_3\) of 4-uniform hypergraphs such that

1. the \(P_4\)-structure of every graph with a balanced skew partition belongs to \(\mathcal C_3\); 2. no odd ring belongs to \(\mathcal C_3\); 3. \(\mathcal C_3\) belongs to NP.

That is a distinct, unnumbered research question: it changes the invariant and is not one of the three requirements on \(\mathcal C_3\). The official HTML likewise places it after Problem 3.

There is a crucial wording difference in the source. Immediately before the three numbered problems, the desired basic-graph class is required to have **no member containing an induced odd ring**. Problem 3 itself merely says that **no odd ring belongs**. These are not equivalent without a heredity requirement. The distinction controls the answer.

A set of points S is Euclidean Ramsey if, for every k, there exists an N so that every k-coloring of Euclidean N-space c

O / open | AMR 问题清单汇编

Graham: A set of points S is Euclidean Ramsey if, for every k, there exists an N so that every k-coloring of Euclidean N-space contains a monochromatic copy of S. Show that, if S can be embedded in some d-dimensional sphere, then it is Euclidean Ramsey. This problem is open even for four points on a circle, although it is known to be true for triangles. (Boris Bukh points out that there is good evidence against this now: here and here, for example.)

13073 | AIM-COMBINATORICS-0200

A sharp lower-bound certificate for the first open transitive tournament case

P / partially_solved | AIM 研讨会问题汇编

Conjecture (Mader, 1985). For every positive integer k, there is a positive integer r such that every r-out-regular digraph contains a subdivision of the transitive tournament on k vertices.

The source notes that the assertion is known for $k=3$, with $r=2$, and for $k=4$, with $r=3$ by Mader (1996). It says that even the existence of an r for $k=5$ is unknown and that $r=6$ is conjectured.

This report uses finite simple digraphs: loops and parallel arcs are excluded, but a digon (both xy and yx) is allowed. This convention is material; Section 8 gives a counterexample if parallel arcs count with multiplicity.

13074 | AIM-COMBINATORICS-0156

A sharp three-edge-color counterexample to the literal conjecture

P / partially_solved | AIM 研讨会问题汇编

The exact AIM record is Conjecture 10 in the 2011 workshop list, in the section “Ruzsa-Szemerédi Theorem and Relatives.” It takes three disjoint sets \(A,B,C\), each of size \(n\), and matchings \(M_1,\ldots,M_\ell\) of triples with one vertex in each part. The forbidden configuration consists of three edges

\[abc,\qquad a'b'c',\qquad a''b''c'' \]

in one \(M_i\), together with the crossing edge \(ab'c''\) in “some other” \(M_j\). The union \(M=\bigcup_i M_i\) is required to be a simple linear \(3\)-graph. The displayed conjecture is

\[|M|=o(n^2). \]

It does not state a bound on \(\ell\), a lower bound on \(|M_i|\), maximality or perfection of the matchings, or that the \(M_i\) form a partition.

The following quantifier audit is therefore necessary.

- “Some other \(M_j\)” naturally means \(j\ne i\). - A matching has its standard meaning: its edges are pairwise vertex-disjoint. It may have size \(0,1,\) or \(2\). - Simple means no repeated hyperedge; linear means that two distinct hyperedges meet in at most one vertex. - The set-theoretic union being simple does not by itself imply that an edge belongs to only one indexed \(M_i\). The counterexample below satisfies the stronger condition that the \(M_i\) are pairwise edge-disjoint and partition \(M\), so this ambiguity cannot rescue the statement.

Under these standard literal quantifiers, the conjecture is false. The source document itself warns elsewhere that some workshop questions may be “rather easy (or even not well-defined),” which is material here.

13076 | AIM-COMBINATORICS-0254

A singleton obstruction to the Katz critical-set question

P / partially_solved | AIM 研讨会问题汇编

Problem 3.17 (N. Katz). Does there exist a finite subset \(A\subset\mathbb Z\), \(|2A|=k|A|\), so that for the function \(f(n,k)\) defined in the previous problem every proper \(A'\subset A\) satisfies \[|nA'|\geq f(n,k)|A'|? \]

Suppose \(A\subseteq\mathbb Z\). If \(|2A|<k|A|\), describe the sumset \(|nA|\) as \(n\) tends to infinity. Find \(f(n,k)\), which is the smallest number such that \[|nA|\leq f(n,k)|A| \] for all \(A\) such that \(|2A|<k|A|\).

For a fixed integer \(n\geq2\) and real \(k>1\), does there exist a nonempty finite \(A\subset\mathbb Z\), preferably \(|A|\geq2\), with \(|2A|=k|A|\) and the stated property for every proper subset?

13077 | AIM-COMBINATORICS-0075

A small Fano-good tight path and the connectedness convention

P / partially_solved | AIM 研讨会问题汇编

Which connected 3-uniform hypergraphs \(H\) satisfy \(R(H,F)=2v(H)-1\)?

The AIM record, attributed to David Conlon, asks which 3-uniform hypergraphs are Ramsey-good with respect to the Fano plane. The record defines \[r(H,F)=2(v(H)-1)+1 \] as the equality of interest and describes a two-part coloring intended to prove the corresponding lower bound.

I use the asymmetric convention now standard in the literature: \(R(H,F)\) is the least \(N\) such that every red/blue coloring of \(\binom{[N]}3\) contains either a **red** copy of \(H\) or a **blue** copy of the Fano plane \(F\). The Fano plane is the 3-graph on seven vertices whose seven edges form the unique Steiner triple system \(S(2,3,7)\). One convenient labeling is \[123,145,167,246,257,347,356. \tag{1} \]

Here hypergraph chromatic number means the weak vertex chromatic number: no edge may be monochromatic. The Fano plane has \(\chi(F)=3\). It has a proper 3-coloring with a singleton class (color \(1\) alone, and color \(\{2,3,4\}\) and \(\{5,6,7\}\) separately in (1)), so \(\sigma(F)=1\). Thus the graph-style Burr expression becomes \(2(v(H)-1)+1\).

There is an important implicit hypothesis. It is not a valid construction for an arbitrary disconnected \(H\): different components can be placed in the two red parts. The literature on Ramsey goodness makes the connectedness convention explicit. Accordingly, the substantive classification question recovered here is:

For completeness, disconnected hypergraphs can still be tested against the numerical equality, but then that equality need not arise from the claimed construction and can have accidental small-order causes.

A two-vertex digon counterexample and an oriented local descent theorem

S / solved | AIM 研讨会问题汇编

For any \(k\) and any digraph \(G\), every vertex of out-degree \(k\) is at directed distance at most \(k\) from a vertex in \(G^*\).

The source list declares at the outset that digraphs are finite unless explicitly stated otherwise, and defines \(N_j^+(v)\) to be the vertices at directed distance exactly \(j\) from \(v\). With \[G^*=\{v\in V(G): |N_2^+(v)|\geq |N^+(v)|\}, \] the displayed conjecture says:

This is a conclusive counterexample to the literal statement. The surrounding problem list nevertheless suggests an intended repair to simple digraphs without loops or digons, and the motivating out-degree-one argument requires that repair. The substantive positive analysis below therefore treats finite **oriented graphs**: loopless digraphs with at most one of \(uv,vu\) present.

An alternating flat family for the complete 3-graph lower bound

P / partially_solved | AIM 研讨会问题汇编

Its exact mathematical assertion is

$$ \pi(K_m^3)=1-\left(\frac{2}{m-1}\right)^2. \tag{1} $$

The record remarks that Sidorenko gives a construction achieving the lower bound and that Mubayi and Keevash found another construction via digraphs.

For a 3-uniform hypergraph F, let $\operatorname{ex}(n,F)$ be the maximum number of triples in an F-free 3-graph and set

$$ \pi(F)=\lim_{n\to\infty}\frac{\operatorname{ex}(n,F)}{\binom n3}. $$

Sidorenko uses the complementary covering density $t(m,3)$, the limiting minimum fraction of triples required to meet every m-vertex set. Thus $\pi(K_m^3)=1-t(m,3)$, and (1) is equivalent to

$$ t(m,3)=\frac{4}{(m-1)^2}. $$

Sidorenko writes this as $t(\alpha+1,3)=(2/\alpha)^2$, while Keevash writes $\pi(K_{t+1}^3)=1-(2/t)^2$. The AIM record omits a quantifier on m. The nontrivial intended reading is: **for every integer $m\geq4$**. The case $m=3$ is tautologically compatible but is not the subject of this complete-hypergraph conjecture.

An explicit 94-vertex cubic-residue candidate and certificate reduction

P / partially_solved | AIM 研讨会问题汇编

A Folkman graph is a K_4-free graph such that every 2-edge-coloring contains a monochromatic triangle. Challenge ($100): find a Folkman graph with fewer than 100 vertices. Candidate construction (Exoo): take $\mathbb Z_{127}$ as vertices, join i to j when $i-j$ is a cubic residue modulo 127, and delete 33 vertices (three independent sets of size 11).

The phrase “three independent sets of size 11” does not itself specify the deleted vertices. Below it is reconstructed canonically from the triangle $\{0,1,2\}$: delete the three common-neighbor sets belonging to its three edges. This is an explicit realization consistent with the source wording, but I did not verify from the inaccessible original Overleaf history that these were Exoo’s intended three sets.

Write \[H=\{x^3:x\in\mathbb F_{127}^{\times}\},\qquad i\sim j\quad\Longleftrightarrow\quad i-j\in H, \] and call the resulting Cayley graph G_{127}. Define \[D=H\cap(1+H)=\{t\in H:t-1\in H\}. \] The explicit deletion set considered here is \[U=D\cup 2D\cup(1+D),\qquad X=G_{127}[\mathbb F_{127}\setminus U]. \]

1, d 2 = a′

2

2

1

2, and it follows that d1 - d2 = a′

1

2

<pre> Problem 1.18 (V. Lev). Let A be a finite non-empty subset of an abelian group G, and write D:= A-A. If any d ∈ D has strictly more than |A|/2 representations of the form

d = a′ - a″ with a′, a ″ ∈ A, then D is a subgroup: indeed, by the pigeonhole principle for any d1, d 2 ∈ D there exists a pair of representations d1 = a′

∈ D.Assume now that any d ∈ D is only guaranteed to have at least |A|/2 representations as d = a′ -a″ with a′, a ″ ∈ A. In this case the argument above doesn't work, and in fact, the conclusion is not true either. To see this, consider the set A:= H ∪ (g + H), where PALO ALTO PROBLEMS 5

H < G is a finite subgroup and g ∈ G is so chosen that the order of g in the quotient group G/H is at least five. Then D = (-g + H) ∪ H ∪ (g + H) is not a subgroup, but a union of three cosets. At the same time, it is easily seen that any d ∈ D has at least

|H| = |A|/2 representations of the form d = a′ - a″.Is this example unique? In other words, given that any d ∈ D has at least |A|/2representations as d = a′ - a″, is it necessarily true that D is either a subgroup or a union of three cosets? For practical applications one should go somewhat beyond the |A|/2 bound. Problem: assuming that any d ∈ D:= A - A has more than |A|/3representations of the form d = a′ - a″ with a′, a ″ ∈ A, is it necessarily true that D is either a subgroup or a union of three cosets? </pre>

Writing \[r_A(d):=\bigl|\{(a',a'')\in A^2:a'-a''=d\}\bigr| =|A\cap(A+d)|, \] the final question is whether \[\min_{d\in A-A}r_A(d)>\frac{|A|}{3} \tag{1.1} \] forces \(A-A\) to be a subgroup or a union of at most three cosets of a common subgroup. The answer is no, even in a cyclic group of odd order.

Cancellation thresholds and a prime-repunit obstruction for multiplicative subgroups

P / partially_solved | AIM 研讨会问题汇编

Let $H\leq \mathbb F_p^*$ be a multiplicative subgroup. How large must H be in order that

$$ \left|\sum_{x\in H}e_p(ax)\right|=o(|H|) \tag{1} $$

hold for all $a\neq0$?

Here the standard notation is

$$ e_p(t)=\exp(2\pi i t/p). $$

The natural uniform interpretation of (1), and the one used in the literature, is that along a family of primes $p\to\infty$ and eligible subgroups $H=H_p$,

$$ M(H):=\max_{a\in\mathbb F_p^*} \left|\sum_{x\in H}e_p(ax)\right|=o(|H|). \tag{2} $$

The notation $H\leq\mathbb F_p^*$, rather than $H\subseteq\mathbb F_p^*$, confirms that H is a subgroup. No change to the mathematical statement beyond restoring the PDF notation is made here.

13147 | AIM-COMBINATORICS-0261

Cantor-direction Kakeya sets and a Hölder graph obstruction

P / partially_solved | AIM 研讨会问题汇编

Let C be a triadic Cantor set. Does there exist $E\subset \mathbb R^2$ with the following properties: 1) E is the union of a 1-D family of unit line segments whose slopes are in C; 2) the Lebesgue measure of E is 0. 3) the union of the doubles of the above line segments has positive Lebesgue measure.

Katz, in the AIM workshop list *Recent trends in additive combinatorics*. The official PDF reads:

The source does not define “triadic Cantor set,” “1-D family,” or “double.” The later paper of Bateman and Katz [BK] uses almost exactly the phrase “a ‘1 dimensional’ family of unit line segments” and explicitly calls that description loose.

For the precise results below, let

$$ C=\left\{\sum_{k=1}^{\infty}\frac{2\varepsilon_k}{3^k}:\varepsilon_k\in\{0,1\}\right\}\subset[0,1] $$

be the standard middle-thirds Cantor set and let

$$ u(m)=\frac{(1,m)}{\sqrt{1+m^2}} $$

be the Euclidean unit direction of slope m. If I is a segment with midpoint c_I, its centered λ-dilate is

$$ \lambda I=\{c_I+\lambda(x-c_I):x\in I\}. $$

In particular, $2I$ has twice the length and the same midpoint and direction. Kroc--Pramanik [KP, Definition 1.1] use precisely the analogous tube convention: same center, orientation, and cross-sectional radius, but multiplied axial length.

{ "id": "AIM-COMBINATORICS-0217", "source": "AIM Problem Lists", "source_type": "PDF", "domain": "Combinatorics", "domain_slug": "combinatorics", "workshop": "Recent trends in additive combinatorics", "workshop_slug": "additivecomb", "section": "", "number": "1.11", "tag": "problem", "problem": "Problem 1.11 (R. Graham).

It does **not** explicitly state an ambient set for \(S_{\alpha,k}\). Problem 1.9 on the same page explicitly writes a set as a subset of \(\mathbb Z\), and Problems 1.8, 1.10, and 1.12 also use integer lattices or \(\mathbb Z\). I therefore take finite subsets of \(\mathbb Z\) as the intended reading, but label this as a reconstruction rather than source text.

The results below are robust to this ambiguity. Lower bounds are proved for arbitrary finite subsets of \(\mathbb R\), while all upper constructions lie in \(\mathbb Z_{>0}\). A nontrivial \(j\)-term arithmetic progression means \[\{a,a+d,\ldots,a+(j-1)d\},\qquad d>0, \] with distinct terms.

Centered affine-fibre density increments for almost containment in A+A

P / partially_solved | AIM 研讨会问题汇编

Let \(A\subset \mathbb F_2^n\) be a set of density \(\alpha\). Then there is a subspace \(V\) of codimension \(\log^{O(1)}(\varepsilon^{-1}\alpha^{-1})\) so that \[|V\cap(A+A)|\geq (1-\varepsilon)|V|. \]

Although written declaratively, comparison with O'Donnell's 2012 open-problem list and Green's updated open-problem list shows that this is intended as a conjecture/problem.

We take \(0<\alpha\leq 1\) and \(0<\varepsilon<1\). The cases \(\varepsilon\geq1\) and \(\alpha=1\) are immediate. The case \(\alpha=0\) is outside the natural formulation, since its claimed bound involves \(\alpha^{-1}\).

13194 | AMR-121-0006

Complexity in Enumerative Combinatorics - Conjecture 6

O / open | AMR 问题清单汇编

Before we proceed to more combinatorial examples, let us mention that D-transcendental GFs are the subject of *Differential Galois Theory*, which goes back to Liouville, Lie, Picard and Vessiot in the 19th century (see e.g. [Ritt]), and continues to be developed [Put-S]. Some natural GFs are known to be D-transcendental, e.g.\ $\Gamma(z)$, $\zeta(z)$, etc., but there are too few methods to prove this in most cases of interest. Here are some of our favorite open problems along these lines, unapproachable with existing tools.

$\sum_{n\ge 1} are D-transcendental.

13195 | AMR-121-0007

Complexity in Enumerative Combinatorics - Conjecture 7

O / open | AMR 问题清单汇编

Here p_n is the n-th prime, and $\pi(n)$ is the number of primes $\le n$, as above. Both GFs are known to be non-D-finite, as shown by Flajolet, Gerhold and Salvy in [FGS] by asymptotic arguments. The authors quip: ``*Almost anything is non-holonomic unless it is holonomic by design*''. Well, maybe so. But the same applies for D-transcendence where the gap between what we believe and what we can prove is much wider. The reader should think of such open problems as the irrationality of $e+\pi$ and $\zeta(5)$, and imagine a similar phenomenon in this case (cf. [KoZ]).

}}$ is D-transcendental.

13200 | AMR-121-0005

Complexity in Enumerative Combinatorics - Problem 5 (Pak--Yeliussizov)

O / open | AMR 问题清单汇编

This also implies that $y(t)$ is not D-finite. Indeed, observe by definition, that if a sequence $\{a_n\}$ is P-recursive, then so is $\{n! $, which implies the result by taking $a_n=B_n/n!$ (cf. [LR]). Of course, there is a more direct way to prove that $y(t)$ is not D-finite by repeated differentiation or via the asymptotics, see below. This suggests the following advanced generalization of Klazar's theorem.

Suppose $\{a_n/n!\}$ is D-algebraic but not P-recursive. Does this imply that $\{a_n\}$ is D-transcendental?

背景链接：https://arxiv.org/abs/1803.06636

13201 | AMR-121-0009

Complexity in Enumerative Combinatorics - Problem 9

O / open | AMR 问题清单汇编

In a forthcoming paper [GP-ADE] we construct an explicit but highly artificial non-symmetric set $S\subset F_k\times F_\ell$ In [KP2] we use the tools in [KP1] to prove that groups have an uncountable set of *spectral radii* $$ \rho(G,S) := \lim_{n\to \infty} a_n(G,S)^{1/n} $$ Since the set of D-algebraic sequence is countable, this implies the existence of D-transcendental Cayley graphs with symmetric S, but such a proof is nonconstructive.

Find an explicit construction of $\Gamma(G,S)$ when S is symmetric, and $

The supplied source URL is <http://aimpl.org/rationalcatalan/1/>. In particular, the misspelling “Lyashoko-Looijenga” is in the source; the standard spelling is “Lyashko--Looijenga.”

Let T be the full set of pseudo-reflections, let ℓ_T be reflection length, let c be a Coxeter element, and let

\[NC(W,c)=[1,c]_T=\{w:\ell_T(w)+\ell_T(w^{-1}c)=n\}. \]

For an integer $p\geq 0$, count weak p-tuples

\[w_1\leq_T\cdots\leq_Tw_p\leq_Tc. \]

The assertion is that their number is

\[C_W(p):=\prod_{i=1}^n\frac{ph+d_i}{d_i}, \]

equivalently that

\[C_W(p)=\sum_{k=1}^n\binom{p+1}{k}F_k, \qquad F_k:=\operatorname{Fact}_k(c). \tag{1} \]

The factors in F_k are ordered, nonidentity, and length-additive. The $p+1$, rather than p, comes from the $p+1$ increments between $1,w_1,\ldots,w_p,c$.

13218 | AIM-COMBINATORICS-0205

Convention obstructions and an oriented-pseudoforest theorem

S / solved | AIM 研讨会问题汇编

Conjecture 6.35 (Thomassé). In a digraph \(D\), \[\sum_{v\in V(D)} \left|\delta_D^+(v)-\delta_D^-(v)\right| + \left|\{(u,v):d(u,v)\leq2\}\right| \geq 2|E(D)| + \left|\{v:\delta_D^+(v)>\delta_D^-(v)\}\right|. \tag{1.1} \]

Note. This is exact for transitive tournaments.

Repaired oriented version. Let \(D\) be a finite simple oriented graph (no loops, parallel arcs, or digons), and count ordered pairs \((u,v)\) with \(u\ne v\). Then (1.1) holds.

The notation section of the same PDF is important:

- a digraph is finite unless stated otherwise; - its incidence-relation definition explicitly allows multiple edges from \(u\) to \(v\); - a *simple* digraph has at most one edge from \(u\) to \(v\); - the text separately uses “no loops or digons” when those properties are required; - \(\delta_D^+(v)\) and \(\delta_D^-(v)\) are the outdegree and indegree of the vertex \(v\), while \(\delta_D^+\) and \(\delta_D^-\) without an argument denote minimum degrees; - \(d(u,v)\) is the length of a shortest directed path from \(u\) to \(v\).

The displayed set must consist of **ordered pairs of distinct vertices**. Indeed, if the diagonal pairs \((v,v)\), whose usual distance is zero, were included, its size would increase by \(n\). The note that (1.1) is exact for every transitive tournament would then be false. Unreachable ordered pairs are understood to have distance \(+\infty\) and are not counted.

The source does not say “simple,” “oriented,” or “digon-free” in Conjecture 6.35. Under its own general definition of digraph, the statement is false:

- a two-vertex digon is a simple counterexample; - even after forbidding digons, the directed triangle with every arc doubled is a counterexample.

The definition's phrase “from \(u\) to another vertex \(v\)” suggests that loops were not intended, although later statements sometimes exclude loops explicitly. If a loop is permitted, the one-vertex one-loop digraph is another counterexample: its two degrees are equal, it has no distinct ordered vertex pair, and (1.1) reads \(0\geq2\).

Thus both simplicity and exclusion of digons are necessary for the most evident repair. The likely intended version is:

This report distinguishes the refuted literal statement from this plausible repaired conjecture.

13221 | AIM-COMBINATORICS-0042

Corrected volumetric characterization of vector balancing

S / solved | AIM 研讨会问题汇编

Let X,Y be norms on $\mathbb R^d$, with unit balls $C=B_X$ and $K=B_Y$. For $v_1,\ldots,v_N\in C$, the source defines \[\operatorname{disc}_Y(v_1,\ldots,v_N) =\min_{\varepsilon\in\{-1,1\}^N} \left\|\sum_{i=1}^N\varepsilon_i v_i\right\|_Y, \] then takes the maximum over all such N-tuples to obtain $\alpha_N(X,Y,d)$ and finally $\alpha(X,Y,d)=\sup_N\alpha_N(X,Y,d)$.

The main text attributes to Banaszczyk the lower bound \[\alpha(X,Y,d)\gtrsim \sqrt d\left(\frac{\operatorname{vol}_d(B_X)} {\operatorname{vol}_d(B_Y)}\right)^{1/d}, \tag{1.1} \] and asks if it is also an upper bound up to logarithmic factors. A universal constant is suppressed in the AIM display; Banaszczyk's 1993 paper [Ban93] gives an explicit constant.

The two database remarks must not be treated as two competing formulas. The first says, in part, \[\min_{B_Y\cap W\subseteq E}\sqrt d\, \frac{\operatorname{vol}(E)^{1/d}} {\operatorname{vol}(B_X\cap W)^{1/d}}, \tag{1.2} \] whereas the second explicitly says “The formula above should be” \[\max_{1\le k\le d}\max_{\dim W=k} \min_{E:\,B_X\cap W\subseteq E} \sqrt{k}\left(\frac{\operatorname{vol}(E)}{\operatorname{vol}(B_Y\cap W)} \right)^{1/k}. \tag{1.3} \] The official 2016 AIM workshop report [AIM16, equation (3)] confirms (1.3) verbatim in substance and specifies that the volumes are Lebesgue measures inside W. Thus the reconstruction is:

* E contains the **input** section $B_X\cap W$; * the denominator is the **output** section $B_Y\cap W$; * both volumes are intrinsic k-dimensional volumes on W; * the roots are $1/k$ and the prefactor is $\sqrt{k}$; * the second remark is a correction of the first.

Formula (1.2) also fails a basic scaling test: enlarging the admissible input ball should make balancing harder, but (1.2) decreases. This independently rules it out as a functional for $\alpha(X,Y,d)$.

13222 | AMR-054-0037

Counting Polyominoes

O / open | AMR 问题清单汇编

How many polyominoes on n squares are there? A polyomino is a connected interior-disjoint union of axis-aligned unit squares joined edge-to-edge, in other words, an edge-connected union of cells in the planar square lattice. The order of a polyomino is the number of unit squares forming it. The problem asks for the number of polyominoes of order n. The key constraint here is that polyominoes must be edge-connected. There are three variations on the problem, depending on whether two polyominoes are considered equivalent by factoring out just translations (fixed polyominoes), rotations and translations (chiral polyominoes), or reflections, rotations, and translations (free polyominoes).

13229 | AMR-125-0014

Coxeter Groups and Unimodality - Conjecture 14

O / open | AMR 问题清单汇编

Many matrices arising in combinatorics are known to be TP (see, e.g., [BreMem], [BreCombTP], and [BreTPComb]). It is therefore surprising that for a fundamental and old combinatorial matrix such as the one consisting of the Eulerian numbers this property has not yet been settled. For $n \in \mathbb{P}$ and $k \in \mathbb{N}$ let $A(n,k)$ be the corresponding *Eulerian number* (so, $A(n,k)$ is the number of permutations in S_n that have k descents). The following conjecture was first put forward in [BreCombTP, Conj. 6.10].

The matrix \[A:=(A(n+1,k))_{n,k \in \mathbb{N}} \] is totally positive.

13236 | AMR-125-0009

Coxeter Groups and Unimodality - Conjecture 9

O / open | AMR 问题清单汇编

So, knowledge of the $ \widetilde{R}$-polynomials is equivalent to knowledge of the R-polynomials. Combinatorial interpretations of the polynomials $\{ \widetilde{R}_{u,v}(t) \}_{u,v \in W}$ have been given in [DeoInv] and [Dye93], see [BB, Thms 5.3.4 and 5.3.7]. It is easy to see that, if $u \leq v$, then $deg(\widetilde{R}_{u,v})=\ell(u,v)$ and the powers appearing in $ \widetilde{R}_{u,v}(t)$ are all of the same parity. More precisely, there is a polynomial $Q_{u,v}(t) \in \mathbb{N}[t]$ such that $ \widetilde{R}_{u,v}(t)= Q_{u,v}(t^2)$ if $\ell(u,v) \equiv 0 \pmod{2}$ and $ \widetilde{R}_{u,v}(t)= t Q_{u,v}(t^2)$ if $\ell(u,v) \equiv 1 \pmod{2}$. It is of interest to characterize the R-polynomials. In this respect I propose the following conjecture which is a generalization of [BreDM, Conj. 7.1].

Let (W,S) be a finite Coxeter system and $u,v \in W$, $u \leq v$. Then the polynomial $Q_{u,v}(t)$ is log-concave.

13256 | AIM-COMBINATORICS-0203

Defect feedback sets and a fractional obstruction for four-order majority digraphs

P / partially_solved | AIM 研讨会问题汇编

Conjecture 6.33 (Thomassé and Charbit). Caccetta--Häggkvist holds for \(3/4\)-digraphs.

Recovered four-order conjecture. Every \(n\)-vertex \(3/4\)-digraph has a vertex \(v\) with \[d^+(v)<\frac n3. \]

The definition is in the immediately preceding source paragraph. Given integers \(\alpha,\beta\) and \(\beta\) linear orders \(\sigma_1,\ldots,\sigma_\beta\) on a finite vertex set \(V\), the associated \(\alpha/\beta\)-digraph \(D\) has

\[xy\in A(D)\quad\Longleftrightarrow\quad x<_{\sigma_i}y\text{ in at least }\alpha\text{ of the }\beta\text{ orders}. \]

Thus a \(3/4\)-digraph is represented by **exactly four** linear orders and has \(xy\) precisely when at least three of the four put \(x\) before \(y\). A \(2\)-\(2\) tie produces no arc in either direction. Repetition among the four orders is not forbidden.

The short AIM sentence is potentially ambiguous about how much of the full Caccetta--Häggkvist girth conjecture is intended. Its own note, and the primary source in Charbit's 2005 thesis, make the concrete question unambiguous:

Because outdegree is integral, this is \(\delta^+(D)\leq\lfloor(n-1)/3\rfloor\). In particular, when \(3\mid n\) the conjecture requires \(\delta^+(D)\leq n/3-1\), not merely \(\delta^+(D)\leq n/3\).

The AIM paragraph also calls an \(\alpha/\beta\)-digraph a “majority digraph” when \(\alpha/\beta>2/3\). This is a supermajority convention, not the unrelated notions called majority digraph or majority coloring in other literatures. For four orders, “strict majority of four voters” in social choice means the same threshold, namely at least three.

Endpoint-deck gluing for one-edge deletion at a 3-uniform Ramsey threshold

P / partially_solved | AIM 研讨会问题汇编

Problem (Dudek--Rödl). Let \(N=r_3(n,n)\). Is it true that every red--blue edge-coloring of \(K_N^{(3)}-e\) contains a monochromatic \(K_n^{(3)}\)? Here \(K_N^{(3)}-e\) denotes the complete 3-uniform hypergraph on \(N\) vertices with one edge deleted.

The source record (AIM problem list, workshop *Graph Ramsey theory*, section *Hypergraph size Ramsey numbers*) asks:

The record also notes the lower bound \(\widehat r_3(n,n)\geq \operatorname{poly}(n)r_3(n,n)^2\), and asks specifically about \(n=4\), where \(r_3(4,4)=13\).

All choices of the deleted triple are equivalent, since the symmetric group on the vertices of \(K_N^{(3)}\) is transitive on triples. Thus the word "every" does not create different deletion types.

There is one boundary issue. Literally, the question is false for \(n=3\): \(K_3^{(3)}\) consists of one edge, so \(r_3(3,3)=3\), whereas deleting that edge leaves no copy of \(K_3^{(3)}\). The explicit emphasis on \(n=4\) and the published formulation for nontrivial clique Ramsey problems indicate that the intended range is \(n\geq4\). We analyze that range below.

Enumeration of Matchings - Problem 16

O / open | AMR 问题清单汇编

For instance, we have the roughly hexagonal region shown at the top of the next page (a union of square and triangular pieces, with certain boundary vertices marked with a ``.''\ so as to bring out the large-scale 2,3,2,2,3,2 hexagonal structure more clearly); it has 17920 tilings, where 17920 is $2^9 \cdot 5 \cdot 7$. More generally, if one takes an a,b,c quasi-hexagon, one finds that one gets a large power of 2 times a product of powers of odd primes in which all the primes are fairly small (and their exponents are too).

Find a formula for the number of diform tilings in the a,b,c quasi-hexagon in the dissection of the plane that arises from slicing the dissection into squares along every third upward-sloping diagonal.

I should mention that one reason for my special interest in Problem 16 is that it seems to be a genuine hybrid of domino tilings of Aztec diamonds and lozenge tilings of hexagons. I should also mention that I think the problem will yield to some generalization of the method of subgraph substitution that has already been of such great use in enumeration of matchings of graphs.

\begin{verbatim} ._____ /| | / | | ./____|_____|_____._____ /| | | /| | / | | | / | | ./____|_____|_____|/____|_____|_____. /| | | /| | | /| / | | | / | | | / | | ./____|_____|_____|/____|_____|_____|/____|_____ | | | /| | | /| | | | | | / | | | / | | | |_____|_____|/____|_____|_____|/____|_____|_____. | /| | | /| | | /| | / | | | / | | | / | ./____|_____|_____|/____|_____|_____|/____|_____ | | | /| | | /| | | | | | / | | | / | | | |_____|_____|/____|_____|_____|/____|_____|_____. | /| | | /| | | / | / | | | / | | | / ./____|_____|_____|/____|_____|_____./ | | /| | | / | | | / | | | |_____./____|_____|_____./ | | / | | / |_____./ \end{verbatim}

I will not go into great detail here on this method (the interested reader can examine {\tt http://www-math.mit.edu/$\sim$propp/} {\tt fpsac96.ps.gz}). Here is an overview: One studies not graphs but weighted graphs, with weights assigned to edges, and one does weighted enumeration of perfect matchings, where the weight of a matching is the product of the weights of the constituent edges. One then looks at local substitutions with a graph that preserve the sum of the weights of the matchings, or more generally, multiply the sum of the weights of the matchings by some predictable factor. Then the problem of weight-enumerating matchings of one graph reduces to the problem of weight-enumerating matchings of another (hopefully simpler) graph. Iterating this procedure, one can often eventually reduce the graph to something one already understands. I am confident that this will apply to Problem 16, yielding a reduction to the standard a,b,c semiregular hexagon.

Enumeration of Matchings - Problem 17

O / open | AMR 问题清单汇编

Characterize those local substitutions that have a predictable effect on the weighted sum of matchings of a graph.

The most useful local substitution so far has been \begin{verbatim}

q q | C / \ D a u b / \ / \ / \ p---t v---r ----> p r \ / \ / d w c \ / | B \ / A s s \end{verbatim} (where unmarked edges have weight 1 and where A,B,C,D are obtained from a,b,c,d by dividing by $ac+bd$), but Rick Kenyon's substitution \begin{verbatim} 3/2 p---q p---q | | | | 1/2 r---s ----> r---s | | 2 | | t---u t u \end{verbatim} has also been of use (where vertices p,q,t,u may be attached elsewhere in the graph, but not the vertices r,s).

13297 | AMR-122-0019

Enumeration of Matchings - Problem 19

O / open | AMR 问题清单汇编

One can also look at graphs that are bipartite but not planar. A natural example is the n-cube (that is, the n-dimensional cube with all sides of length 2). It has been shown that the number of perfect matchings of the n-cube goes like 1, 2, $9=3^2$, $272=16 \cdot 17$, $589185=3^2 \cdot 5 \cdot 13093$, $\dots$.

Find a formula for the number of perfect matchings of the n-cube.

(This may be intractable; after all, the graph has exponentially many vertices.)

背景链接：https://arxiv.org/abs/math/9801060

13298 | AMR-122-0002

Enumeration of Matchings - Problem 2

O / open | AMR 问题清单汇编

\end{verbatim} These are similar to the numbers one gets from counting lozenge-tilings of an n,n,n,n,n,n hexagon, in that the largest prime factor seems to be bounded by a linear function of n, and it ought to be possible to come up with a conjectural exact formula. What might be harder is proving it.

Enumerate the lozenge-tilings of the region obtained from the $n,n+1,n,n+1,n,n+1$ hexagon by removing the central triangle.

Enumeration of Matchings - Problem 5

O / open | AMR 问题清单汇编

Determine the cokernel of the Carlitz matrices, or equivalently of the Kasteleyn matrices of a,b,c hexagons, and if possible find a way to interpret the cokernel in terms of the tilings.

He points out that in the case $a=b=c=2$, one gets a non-cyclic group as the cokernel.

背景链接：https://arxiv.org/abs/math/9801060

13302 | AMR-122-0006

Enumeration of Matchings - Problem 6

O / open | AMR 问题清单汇编

Digressing for a moment from the topic of lozenge tilings, I point out that in general, the Kasteleyn matrix K is not canonically defined, in the sense that there may be many ways of modifying the signs of certain entries of the bipartite adjacency matrix of a graph so that all non-zero contributions to the determinant have the same sign. Thus, one should not expect the eigenvalues of K to possess combinatorial significance. However, the spectrum of K times its adjoint K^* is independent of which Kasteleyn matrix K one chooses (independently shown by David Wilson and Horst Sachs). Thus, it is natural to ask:

What is the significance of the spectrum of $K K^*$, where K is any Kasteleyn matrix associated with a bipartite planar graph?

Exact anatomy of the BCW circular construction

P / partially_solved | AIM 研讨会问题汇编

Behzad--Chartrand--Wall conjecture. For integers \(r\ge1\) and \(g\ge2\), the minimum order of an \(r\)-regular digraph of directed girth \(g\) is \[r(g-1)+1. \]

Sullivan's 2006 AIM workshop survey *A Summary of Results and Problems Related to the Caccetta--Häggkvist Conjecture*. Section 4 defines an \(r\)-regular digraph by \[d^+(v)=d^-(v)=r\qquad\text{for every vertex }v.

Equivalently, every \(r\)-regular digraph of order \(n\) has directed girth \[g(D)\le \left\lceil\frac nr\right\rceil. \] The construction giving the upper bound has vertex set \(\mathbb Z_{r(g-1)+1}\) and arcs \[i\longrightarrow i+s\pmod {r(g-1)+1}, \qquad 1\le s\le r. \tag{1} \] This is the precise meaning of placing the vertices on a circle and joining each vertex to the next \(r\) clockwise vertices [1,2,10].

There is a convention subtlety. The AIM survey allows parallel arcs in its ambient definition of “digraph,” but the original cage problem and later precise formulations use at most one arc for each ordered pair. Shen and Gregory explicitly allow loops but no multiple arcs [7]. In the cage range \(g\ge2\), loops are automatically absent. Digons are allowed when \(g=2\), while \(g\ge3\) automatically excludes them. Thus the construction is loopless for all \(r\ge1,g\ge2\), is the complete bidirected digraph when \(g=2\), and is oriented when \(g\ge3\).

The raw record continues through Sections 5 and 6 of the source. Those passages on connectivity, additive combinatorics, Plünnecke graphs, and rainbow conjectures are nearby source context, not part of Conjecture 4.1.

Exact deficit identity for recursive tight-cycle constructions

P / partially_solved | AIM 研讨会问题汇编

It defines \[C_5^3=\{123,234,345,451,512\} \] and asks for the classical edge-density Turán value. Its conjecture is \[\boxed{\pi(C_5^3)=2\sqrt3-3.} \] Here \[\pi(F)=\lim_{n\to\infty}\frac{\operatorname{ex}(n,F)}{\binom n3}, \] where copies are ordinary (not necessarily induced) injective copies of a 3-uniform hypergraph.

The displayed five edges are all cyclically consecutive triples on five distinct vertices, so this is the **full tight cycle**. It is not:

- the four-edge hypergraph \(C_5^{3-}\), obtained by deleting one edge; - a loose or linear cycle; - the expansion of an ordinary graph cycle (which introduces private new vertices for graph edges); - a minimum-codegree, covering, tiling, or uniformly-dense Turán problem.

These distinctions matter. In particular, the 2024--2025 results proving \(\pi(C_5^{3-})=1/4\), and codegree results about tight cycles, do not answer this record.

The source statement is mathematically coherent. Its only historical compression is that the currently public numerical upper certificate is usually quoted more accurately as \(0.468287\), while the record rounds it to \(<0.4683\).

13512 | AIM-COMBINATORICS-0197

Exact feedback sets in cyclic tournament substitutions

P / partially_solved | AIM 研讨会问题汇编

Conjecture 6.27 (Chudnovsky--Seymour--Sullivan). Let \(G\) be a simple digraph with \(k\) non-edges, where a non-edge is an unordered pair \(\{u,v\}\) for which neither \(uv\) nor \(vu\) is an arc. If \(G\) has no directed cycle of length at most \(3\), then one can delete at most \(k/2\) edges from \(G\) and obtain an acyclic digraph.

Sullivan's 2006 AIM survey.

For a digraph \(G\), write \[\gamma(G):= \bigl|\{\{u,v\}:u\ne v,\ uv,vu\notin E(G)\}\bigr| \] and let \(\beta(G)\) be the minimum cardinality of an **arc** set \(F\subseteq E(G)\) such that \(G-F\) is acyclic. The source conjecture is therefore \[\beta(G)\leq \frac{\gamma(G)}2. \tag{CSS} \] Because \(\beta(G)\) is integral, the literal meaning of “at most \(k/2\) edges” is \[\beta(G)\leq \left\lfloor\frac{k}{2}\right\rfloor. \] In particular, equality in the integer formulation can occur for odd \(k\), even though equality in the real-valued display cannot.

The conventions need care.

- Some authors use “simple digraph” while still allowing a pair of opposite arcs. This ambiguity is harmless here: opposite arcs form a directed \(2\)-cycle and are excluded by the hypothesis. Thus every admissible digraph is oriented. - The deletion is of arcs, not vertices. A feedback vertex set is a different parameter and is not addressed by the conjecture. - “No directed cycle of length at most \(3\)” excludes loops, digons, and directed triangles. Simplicity already excludes loops in the usual convention. - The source note says that tight examples include transitive tournaments, \(C_4\), and “products,” but it does not define the product operation. The primary Chudnovsky--Seymour--Sullivan paper displays a balanced four-bag substitution: each vertex of a directed \(4\)-cycle is replaced by a transitive tournament, and consecutive bags are joined completely in the cyclic direction. This is the lexicographic product \(C_4\circ T_t\). Section 5 treats this operation precisely.

13518 | AIM-COMBINATORICS-0152

Exact profiles for the odd book construction

P / partially_solved | AIM 研讨会问题汇编

The AIM record, from the workshop list “Hypergraph Turán problem,” section “Turán functions for books,” conjectures

\[\pi(B_{5,5})=\frac{40}{81},\qquad \pi(B_{6,6})=\frac12. \]

The notation is important. Following Bohman-Frieze-Mubayi-Pikhurko, for \(2\leq m\leq k\), the \(k\)-uniform book \(B_{k,m}\) has pages

\[[k-1]\cup\{k+i-1\}\quad (i=1,\ldots,m) \]

and binding edge \(\{k,k+1,\ldots,2k-1\}\). Thus \(B_{k,k}\) consists of a spine \(S\) of size \(k-1\), a set \(T\) of \(k\) tips, all pages \(S\cup\{t\}\) for \(t\in T\), and the binding edge \(T\). This is not the ordinary graph-theoretic book convention.

For a \(k\)-graph \(H\), define

\[N_H(S)=\{v\notin S:S\cup\{v\}\in H\},\qquad |S|=k-1. \]

Then \(H\) is \(B_{k,k}\)-free if and only if every \(N_H(S)\) is an independent set in \(H\): an edge \(T\subseteq N_H(S)\) is exactly the binding of a copy with spine \(S\). This is the “independent neighborhoods” formulation used in the primary paper.

13521 | AIM-COMBINATORICS-0280

Exact structure and coloring of the proposed even-hole-free circulants

O / open | AIM 研讨会问题汇编

Every non-empty even-hole-free circulant is isomorphic to a $G(k,m)$.

It begins in the middle of the proof of the implications among Conjectures 2, 3, and 4 in Section G.4, contains all of Section G.5, and then absorbs G.6, Chapters H, I, and J, and the beginning of Chapter K.

The embedded items can be delimited as follows.

1. carried-over proof prose from G.4 on even-hole-free graphs; 2. G.5, the classification conjecture for even-hole-free circulants; 3. G.6, the question asking for a characterization of beta-perfect graphs; 4. H.1--H.4, several unrelated questions about partitionable graphs; 5. Chapter I, a collection of imperfection-ratio bounds and conjectures; 6. Chapter J, two integer-programming questions; and 7. the opening definitions of Chapter K on balanced graphs.

Only item 2 is studied here. No claim below addresses any other embedded record.

For integers $k\geq 1$ and $m\geq 0$, put

\[L=2m+1,\qquad n=kL, \]

and take $V=\mathbb Z_n$. The source includes loops and declares (i,j) to be an edge when, for some integer t,

\[i-j+tL\equiv 0,\ +1,\text{ or }-1\pmod n. \tag{1} \]

We write $G(k,m)$ for the **underlying simple graph**, obtained by deleting the source's convenient loops. The displayed conjecture is:

The source additionally prints

\[\omega(G(k,m))=2k, \qquad 2k+\left\lceil\frac{k}{m}\right\rceil \leq \chi(G(k,m)) \leq 2k+\left\lceil\frac{k}{m}\right\rceil+1. \tag{2} \]

There are two necessary repairs.

* Formula (2) is meaningful only for $m\geq1$, and its clique assertion is correct only for $m\geq2$. * In their subsequent 2005 technical report, Andrade, Boros, and Gurvich say that they always restrict to connected circulants. Without this convention, the displayed classification is false; a counterexample is proved below.

Accordingly, the intended unresolved question is recovered as the classification of **connected**, nonempty, even-hole-free simple circulants. The family itself retains the source range $k\geq1,m\geq0$.

来源字段：https://aimath.org/WWN/perfectgraph/perfectgraph.pdf

13522 | AIM-COMBINATORICS-0032

Exact structure inside a two-fold sumset

P / partially_solved | AIM 研讨会问题汇编

Let \(A\subset \mathbb F_2^n\) be a subset of density \(0.01\). Then there is a subset \(B\subset \mathbb F_2^n\) with density absolute constant, so that \[B+B\subset A+A \] and \[B=S_1+\cdots+S_\ell \] for some sets \(S_i\)'s with \(|S_i|\leq \operatorname{poly}(n)\) and \(\ell\leq \operatorname{poly}(n)\).

The source says:

The live page was checked on 29 July 2026. It has the same text, the attribution above, and no status or explanatory remark. Its placement and `problem` tag show that the declarative sentence is a proposed assertion to prove, not a theorem reported with a proof.

There are two necessary quantifier repairs.

1. **Literal density \(0.01\) is impossible.** A subset of \(\mathbb F_2^n\) has density \(m/2^n\). Equality \(m/2^n=1/100\) would imply \(100m=2^n\), impossible because \(25\nmid 2^n\). Thus the literal statement has no instances and is vacuously true. In additive-combinatorics usage, “density \(0.01\)” here must mean “density at least \(0.01\)” (or a fixed positive density, with harmless rounding). 2. The words “absolute constant” and “\(\operatorname{poly}(n)\)” must be uniform. A precise intended reading is: there exist constants \(c>0\), \(C,D<\infty\), and \(n_0\), independent of \(n\) and \(A\), such that every \(n\geq n_0\) and every \(A\subset\mathbb F_2^n\) with \(|A|\geq .01\,2^n\) admit nonempty \(S_1,\dots,S_\ell\) and \(B\) satisfying \[|B|\geq c2^n,\qquad B+B\subset A+A, \qquad B=S_1+\cdots+S_\ell, \] \[\ell\leq n^D,\qquad |S_i|\leq n^C. \] Without uniform exponents, one could take \(\ell=1\), \(S_1=B=A\), and choose an exponent separately for each finite instance; that is not a meaningful conjecture.

All mathematical analysis below concerns this repaired, uniform version.

来源字段：http://aimpl.org/addcombapp/2/

13523 | AIM-COMBINATORICS-0263

Exact subgroup self-sumsets and a robust quotient-character leakage bound

P / partially_solved | AIM 研讨会问题汇编

Problem 4.7 (A. Granville and T. Tao). Suppose that \(G\) is a proper subgroup of the multiplicative group of \(\mathbb F_p\). Let \(A\subset \mathbb F_p\) such that \(A+A=G\) or \(A+A\) is slightly larger than \(G\). Do such \(A\) exist, and do they necessarily have structure?

Another version of this question is as follows: given that \(|A|>p^\varepsilon\), can \(A+A\) be contained in a proper subgroup of \(\mathbb F_p^*\)?

Remark(s). Probably a very hard question, at least for small \(\varepsilon>0\). Negative answer would imply Vinogradov's conjecture that the least quadratic non-residue modulo \(p\) is smaller than \(p^\varepsilon\), for \(p\) sufficiently large. This problem is very close to Problem 3.6.

Exact trace certificates and a regular counterexample normal form for Caccetta--Haggkvist

P / partially_solved | AIM 研讨会问题汇编

Caccetta--Häggkvist conjecture. Every simple \(n\)-vertex digraph with minimum outdegree at least \(r\) has a directed cycle of length at most \[\left\lceil\frac nr\right\rceil . \]

Sullivan's 14 April 2006 AIM workshop survey, *A Summary of Results and Problems Related to the Caccetta--Häggkvist Conjecture*. Inspection of the original PDF recovers Conjecture 2.1 as follows.

Here \(r\) is a positive integer. We take the digraph to be loopless, with at most one arc in each ordered direction. The **directed girth** \(g(D)\) is the least number of arcs in a directed cycle, and is infinity for an acyclic digraph. The ceiling is essential: for example \(n=7,r=2\) predicts a cycle of length at most four, not three.

There is a convention mismatch inside the source which must be made explicit. Its definition of “simple digraph” excludes parallel copies of an arc but does not exclude having both \(u\to v\) and \(v\to u\). Such a pair is a **digon**. The matrix restatement, however, requires \(a_{ij}=1\Rightarrow a_{ji}=0\) for \(i\ne j\), which encodes an **oriented graph** (no digons). This causes no loss: a digon is already a directed 2-cycle, and \(\lceil n/r\rceil\geq2\) whenever a loopless \(n\)-vertex digraph can have outdegree \(r\leq n-1\). Thus every counterexample would be oriented.

For the matrix formulation, let \(B\) be the ordinary adjacency matrix: \(b_{ii}=0\), and \(b_{ij}=1\) exactly when \(i\to j\) is an actual arc. The source's matrix is \[A=I+B. \tag{1} \] Its diagonal ones are artificial “wait” moves, not loops of the original digraph. Hence a row sum at least \(r+1\) means actual outdegree at least \(r\). With \(L=\lceil n/r\rceil\), the source asserts \[\operatorname{tr}(A^L)>n. \tag{2} \] Theorem 1 below proves the exact equivalence, including why the inequality is strict and why a closed walk suffices to obtain a simple directed cycle.

The historical bullets in the record describe the state in 2006; they are not treated as present-day claims.

13533 | AIM-COMBINATORICS-0151

Explicit residue formulas for the solved generalized-triangle problem

S / solved | AIM 研讨会问题汇编

Frankl and Füredi determined $\pi(B_{k,2})$ for $k=5,6$; in both cases the lower bound comes from blowing up a small design. Determine $\operatorname{ex}(n,B_{5,2})$ and $\operatorname{ex}(n,B_{6,2})$ exactly for all large n.

The record adds that the missing stability property was the main difficulty.

The 2011 workshop report defines the k-uniform book $B_{k,m}$ as follows. There are m page edges sharing a common set X of $k-1$ vertices:

$$ X\cup\{y_1\},\ldots,X\cup\{y_m\}, $$

and one further k-edge contains the m vertices $y_1,\ldots,y_m$ and is otherwise disjoint from the page edges. In particular, $B_{k,2}$ has vertex set

$$ X\mathbin{\dot\cup}\{y_1,y_2\}\mathbin{\dot\cup}Z, \qquad |X|=k-1,\quad |Z|=k-2, $$

$$ X\cup\{y_1\},\qquad X\cup\{y_2\},\qquad \{y_1,y_2\}\cup Z. \tag{1} $$

Thus $B_{k,2}$ is exactly the generalized k-uniform triangle $\mathcal T_k$ used by Norin and Yepremyan. This identification is important: the word “book” alone does not specify the uniformity or the closing edge.

Extending Pseudosegment Arrangements by Subdivision

O / open | AMR 问题清单汇编

How many intersections among an arrangement of pseudosegments in the plane must be added as vertices to allow the pseudosegment arrangment to be extended to a pseudoline arrangement? An arrangement of pseudosegments in the plane is a family of finite-length planar curves such that every two curves intersect in at most one point. An arrangement of pseudolines in the plane is a family of planar curves that extend to infinity on both ends such that every two curves intersect in at most one point. Only some pseudosegment arrangements can be extended to pseudoline arrangements. However, if we allow turning intersection points into vertices of the arrangement, thereby subdividing the segments, then it is always possible to make a pseudosegment arrangement extendible. The question is how many such vertices must be added in the worst-case in terms of the number n of pseudosegments.

Extremal Questions in Discrete Geometry and Topological Combinatorics

P / partially_solved | Oberwolfach 报告问题汇编

别名：Duplicate Discrete-Geometry Problem Collection [OWR-1703876-017]

For a simplicial 4-polytope P with n vertices in which every three vertices contain an edge, must its graph contain a clique of size at least $n/10$? Given two continuous probability measures on S^2 and $0<\alpha<1/2$, must some spherical cap have measure α for both? Must every simple red-blue pseudoline arrangement contain a bounded triangular face incident to both colors? For a hypergraph H, does $m_2^*=3$ imply that m_3^* is finite? Finally, what is the minimum number of partial triangulations of n points in general position in the plane, and is it $C_{n-2}=\frac{1}{n-1}\binom{2n-4}{n-2}$?

Extremal sumset examples: Hamming balls and sharp no-carry digit cubes

P / partially_solved | AIM 研讨会问题汇编

The AIM record, under the heading “Finding examples,” contains three requests:

1. “Find counter examples to the polynomial Bogolyubov Ruzsa theorem.” 2. “Find interesting examples of subset \(A\subset\mathbb F_2^n\) so that \(A+A\) is far from all of \(\mathbb F_2^n\).” 3. “Find interesting examples of \(A\subset[N]\) of density \(\alpha\) so that \(4A\) does not contain long APs.”

It did not assert that the conjecture was known false. The first request also does not specify a theorem statement, a summand count, or a parameter to falsify. Source-era terminology distinguished at least two assertions:

* A **dense polynomial Bogolyubov statement** asks whether every density-\(\alpha\) set \(A\subseteq\mathbb F_2^n\) has a linear subspace of codimension \(O(\log(1/\alpha))\) inside \(4A\). * A **small-doubling polynomial Bogolyubov--Ruzsa statement** asks whether \(|A+A|\leq K|A|\) forces a subspace \(V\subseteq tA\), for some fixed absolute \(t\), with \(|V|\geq K^{-O(1)}|A|\).

These are stronger fixed-sumset statements than merely covering \(A\) by polynomially many cosets of a subspace. The latter is Marton's polynomial Freiman--Ruzsa (PFR) conjecture, now a theorem in \(\mathbb F_2^n\). Thus “find counterexamples to the theorem” is obsolete if “theorem” meant PFR, while the stronger fixed-\(t\) polynomial Bogolyubov conjecture remains a viable open problem in general. In special structured settings polynomial Bogolyubov-type results have also been proved. No counterexample to a proved theorem can be sought within its hypotheses.

We therefore recover the mathematical task as follows: construct and exactly analyze extremal families which test the best possible polynomial dependence, are far from affine-subspace models while making \(A+A\) quantitatively far from the ambient vector space, or keep arithmetic progressions in an integer fourfold sumset short.

Conventions are essential:

* In \(\mathbb F_2^n\), addition is coordinatewise modulo 2 and \(jA=\{a_1+\cdots+a_j:a_i\in A\}\). Repetition is allowed. Because the characteristic is 2, subtraction and addition agree. * In \(\mathbb Z\), \(jA\) is the ordinary Minkowski sum with repetition. There is no modular wraparound. * An arithmetic progression is nonconstant and has positive integer common difference. * For the second request, we report two explicit metrics. The missing density of the sumset is \[1-\frac{|A+A|}{2^n}. \] For comparison with affine-subspace models, we use normalized symmetric difference \[\frac{|A\mathbin\triangle U|}{|A|+|U|} \] for affine subspaces \(U\) on the same cardinality scale as \(A\). The source itself does not prescribe a unique metric or scale.

13558 | AIM-COMBINATORICS-0065

Fixed predicates, bounded complexity, and a universal parameter lift

P / partially_solved | AIM 研讨会问题汇编

Problem (Conlon--Fox--Pach--Sudakov--Suk). Is \(R_f^{(3)}(4,n)\) polynomial in \(n\)?

The preceding source records supply the intended convention. A single polynomial \[f:(\mathbb R^2)^3\longrightarrow \mathbb R \] is fixed. For each ordered finite set \(P=(v_1,\ldots,v_N)\subset\mathbb R^2\), form the ordered 3-uniform hypergraph \(H_f(P)\) in which, for \(i<j<k\), \[\{v_i,v_j,v_k\}\in E(H_f(P)) \quad\Longleftrightarrow\quad f(v_i,v_j,v_k)\geq 0. \] Then \(R_f^{(3)}(4,n)\) is the least \(N\) such that every such ordered \(N\)-point set gives either a 4-clique or an independent set of size \(n\). Thus the literal question fixes all of the following across all \(n\): the plane as ambient space, one polynomial, its coefficients, and the edge rule \(f\geq0\).

This is not the same quantifier order as the now-standard bounded-complexity number \(R_r^{\mathbf t}(s,n)\), where \(\mathbf t=(d,D,m)\) is fixed but the \(m\) defining polynomials and the Boolean function of their sign pattern may vary with the instance and hence with \(n\).

The source also records a connection between \(R_f^{(4)}(5,n)\) and the Erdős--Szekeres convex-polygon problem. Section 7 below makes that connection exact under the usual general-position convention.

13561 | AIM-COMBINATORICS-0063

Fixed-polynomial semi-algebraic Ramsey bounds and unbounded-degree universality

P / partially_solved | AIM 研讨会问题汇编

The source asks the following question, attributed to Andrew Suk. For each n, let H_n be a k-uniform hypergraph whose vertices are labelled points $$P=(v_1,\ldots,v_n)\in(\mathbb R^2)^n,$$ and, for $i_1<\cdots<i_k$, put $$\{v_{i_1},\ldots,v_{i_k}\}\in E(H_n)\quad\Longleftrightarrow\quad f(v_{i_1},\ldots,v_{i_k})\geq 0,$$ where f is one polynomial in the $2k$ coordinates. What order of magnitude can be guaranteed for the largest clique or independent set? The source denotes the worst guarantee by $$r_f(n)=\min_{H_n}\max\{\alpha(H_n),\omega(H_n)\}.$$

There are two quantifier issues in that notation.

1. I interpret f as fixed while n and the point sequence vary. More explicitly, for an ordered sequence P of distinct points let $H_f(P)$ be the hypergraph above, and define $$r_f(n)=\min_{P\in(\mathbb R^2)^n\text{ distinct}}\max\{\alpha(H_f(P)),\omega(H_f(P))\}.$$ This is the reading for which the subscript f is meaningful. 2. The relation need not be invariant under permutations of its k arguments. Thus the labels, or equivalently the linear order on the vertices, are part of the structure. This agrees with the ordered-set formulation in Adibelli--Tomon. If the intended object was an unordered geometric relation, one should additionally assume that the sign of f is permutation-invariant on distinct inputs.

Define the associated Ramsey threshold $$R_f(m)=\min\{N:\text{ every ordered }N\text{-point configuration has an }f\text{-homogeneous }m\text{-set}\}.$$ Then, with integer endpoints understood, $$r_f(N)\geq m\quad\Longleftrightarrow\quad R_f(m)\leq N. \tag{1}$$ This elementary inverse relation is useful because the literature is mostly stated in terms of R_f.

The source records the ordinary hypergraph-Ramsey guarantee $c\log^{(k-1)}n$, where $\log^{(j)}$ denotes j-fold iteration, not a power. Below, all logarithms are base two; changing the base only changes constants.

13567 | AIM-COMBINATORICS-0091

Fourier completion of a roots-of-unity hypergraph Laplacian

P / partially_solved | AIM 研讨会问题汇编

The mathematical question is whether chip-firing on graphs has a useful extension to a \(k\)-uniform hypergraph equipped with a cyclic order on every edge, with the \(k\)th roots of unity replacing the signs \(+1,-1\). Spencer Backman reported a complex positive-semidefinite Laplacian, independence from an auxiliary total order on the vertices, and asked for its kernel and for analogues of nonnegative, reduced, and recurrent configurations. Andrea Sportiello suggested replacing roots of unity by arbitrary edge vectors whose coordinates sum to zero.

1. The isolated “1” after “workshop's website” is a footnote marker; the footnote gives `aimath.org/WWN/chipfiring/`. 2. The last displayed phrase in the PDF is “between \(\omega\) and \(\omega^{n-1}\).” The problem otherwise uses \(k\), not \(n\). Thus \(n\) is undefined there and may be a notational slip. It is not silently changed below.

The old workshop landing page remains accessible, but its participant-list endpoint (which was supposed to contain Backman's statement of interest) was not recoverable in this run. Consequently, the exact unpublished firing convention could not be verified. It realizes exactly the advertised positivity and order-independence, specializes to the ordinary graph Laplacian when \(k=2\), and is the same general operator later studied by Mulas and Reff. Claims about Backman's unpublished setup are therefore phrased conditionally on this reconstruction.

13571 | AIM-COMBINATORICS-0078

Free-cut decomposition for ordered matchings versus triangles

P / partially_solved | AIM 研讨会问题汇编

Does there exist \(\epsilon>0\) such that \[r_<(K_3,M)=O(n^{2-\epsilon}) \] for every ordered matching \(M\) on \(n\) vertices?

The source also records the uniform bound \(r_<(K_3,M)\le r_<(K_3,K_n)=\Theta(n^2/\log n)\) and an existential lower bound with exponent \(4/3+o(1)\).

Here and in the cited primary papers, \(n\) is the **number of vertices** of the ordered matching, not the number of matching edges. Thus a perfect matching has \(n/2\) edges and \(n\) is even. This matters when comparing the nested matching \(NM_q\), which is conventionally indexed by its \(q\) edges and has \(2q\) vertices.

There are competing argument/color conventions in the literature. To remove the ambiguity, throughout this report define \[R(M):=\min\{N:\text{every red/blue coloring of }K_N^< \text{ has a red }K_3\text{ or a blue ordered }M\}. \] This is the quantity written \(r_<(K_3,M)\) in the AIM question. Papers that write \(r_<(M,K_3)\) with “blue \(M\) or red \(K_3\)” are studying exactly the same quantity. More generally, swapping both arguments and color names does not change an off-diagonal Ramsey number.

Good Freiman models from polynomial coset covers

P / partially_solved | AIM 研讨会问题汇编

If \(A\) is a finite subset of an abelian group \(G\) and

\[|A+A|\leq K|A|, \]

must there be \(A'\subseteq A\), with \(|A'|\geq K^{-O(1)}|A|\), and a finite group \(H\), with \(|H|\leq K^{O(1)}|A|\), such that \(A'\) is Freiman-isomorphic to a subset of \(H\)? Here a Freiman isomorphism means a map \(\phi\) such that, for every \(a,b,c,d\) in its domain,

\[a+b=c+d \quad\Longleftrightarrow\quad \phi(a)+\phi(b)=\phi(c)+\phi(d). \]

The 2018 workshop report states the target slightly more strongly as \(|H|\leq C K^C|A'|\), with an absolute \(C\). The results below keep these normalizations separate and, in the bounded-torsion cases, satisfy both.

The input sentence “this is false for arbitrary groups” is read as saying that the preceding *whole-set* polynomial modeling assertion is false in that generality; it does not answer the subsequent large-subset question.

How many colors is it necessary to use so that, if you paint every single point of the two-dimensional plane some color

P / partially_solved | AMR 问题清单汇编

Erdős: How many colors is it necessary to use so that, if you paint every single point of the two-dimensional plane some color, no two points which are a distance one from each other are the same color? (That is, what is the chromatic number of the unit distance graph in the plane?) It's not hard to show that the number is between 4 and 7 -- but nobody has a clue where it falls in between. Recently, De Grey showed it's at least 5. See this. A related problem, due to Chris Dillard: Consider B_(r), the Ball of radius r about 0 in R^(2). What is the chromatic number of the unit distance graph on B_(r)? We know that, for r < 1/2, it is 1; for r = 1/2, it is 2; for 1/2 < r <= sqrt(3)/3, it's 3. How about for r > sqrt(3)/3? At some r_(0), the chromatic number must become 4. It is easy to see that r_(0)is no more than 3/sqrt(11) : see the figure below. In fact, it is possible to improve this to sqrt(3)/2, but that still leaves a sizable gap.

13612 | AIM-COMBINATORICS-0076

Increasing paths and two certificates for the Chung-Graham sum question

P / partially_solved | AIM 研讨会问题汇编

The AIM record, attributed to Ron Graham, gives every edge of a graph a distinct label. For the complete graph it asks whether there is an absolute constant \(c>0\) such that \[\max_{v\in V(K_n)}t(v)\ge cn, \] where \(t(v)\) is the maximum length of an increasing path starting at \(v\). It then asks, for every edge-ordered graph \(G\), whether \[\sum_{v\in V(G)}t(v)\ge |E(G)|. \tag{1.1} \]

The conventions are recoverable from the primary literature. A path is **simple**: its vertices are distinct. Its length is its number of edges. An increasing path \(v_0v_1\cdots v_\ell\) satisfies \[\lambda(v_0v_1)<\lambda(v_1v_2)<\cdots<\lambda(v_{\ell-1}v_\ell). \] A trail may revisit vertices and is treated as a different, easier problem. This distinction is explicit in Milans and in Bucić--Kwan--Pokrovskiy--Sudakov--Tran--Wagner. Isolated vertices have \(t(v)=0\).

Joints of lines over finite fields

P / partially_solved | AIM 研讨会问题汇编

Take \(n\) lines in \(\mathbb R^3\). Define a joint to be a point with three lines passing through it that are not coplanar. How many joints can there be?

Let \(\mathcal L\) be a set of \(L\) distinct affine lines in \(\mathbb F_q^3\). A point is a **joint** if it lies on three lines of \(\mathcal L\) whose direction vectors are linearly independent. Bound, and if possible determine, the maximum number \(J\) of joints in terms of \(L\) (and the field size \(q\)).

13641 | AIM-COMBINATORICS-0034

Kernel saturation and rank-sensitive Komlos discrepancy

P / partially_solved | AIM 研讨会问题汇编

There is a universal constant \(c>0\) such that for every \(v_1,\ldots,v_n\in \mathbb B_2^d\), there are signs \(\varepsilon_1,\ldots,\varepsilon_n\in\{-1,1\}\) for which \[\left\|\sum_{i=1}^n\varepsilon_i v_i\right\|_\infty\leq c. \]

Here \(\mathbb B_2^d=\{v\in\mathbb R^d:\|v\|_2\leq1\}\). Equivalently, if \(A=[v_1\ \cdots\ v_n]\in\mathbb R^{d\times n}\) has column Euclidean norms at most one, the conjecture says \[\operatorname{disc}(A):=\min_{\varepsilon\in\{-1,1\}^n} \|A\varepsilon\|_\infty=O(1), \] with an absolute implied constant independent of \(d,n\), and of \(A\).

The source literature field says that \(O(\sqrt{\log\min\{d,n\}})\) was given by “Banaszczyk'98” and “Naor'05.” Banaszczyk's published 1998 theorem was verified. The record gives no title for the Naor shorthand, and a matching primary 2005 publication was not located, so no bibliographic metadata is invented here.

Lacunary counterexamples to the asymmetric Freiman container question

P / partially_solved | AIM 研讨会问题汇编

Tao. Let \(A,B\subseteq\mathbb Z\) be finite, with \[|A|=m>|B|=n, \qquad |A+B|<Km. \] Must there be a generalized arithmetic progression \(P\) of rank \(c(K)\), containing \(B\), and a set \(X\subseteq\mathbb Z\) such that \[A\subseteq P+X, \qquad |P+X|\le c(K)|A|? \tag{Q} \]

Its missing symbols are \[|P+P|\le c(K,\varepsilon)m^{\varepsilon}|P|. \tag{R} \] The complete recovered remark says that Plünnecke's inequality gives the desired type of covering if the requirement that \(P\) be a progression is weakened to (R); in that version \(P\) is merely a set with somewhat small sumset. The source also notes that \(m=n\) is the case of Freiman's theorem.

Croot and Lev later restated the question as “Freiman's theorem for distinct set summands,” using a constant \(C=C(K)\) to bound both the rank and \(|X+P|/|A|\). They explicitly note that the comparable-size regime \(|A|\asymp|B|\) follows from Freiman's theorem and Ruzsa covering.

Link structure and sharp edge bounds for three-edge tight-path-free triple systems

P / partially_solved | AIM 研讨会问题汇编

\[P_s=\{123,234,345,\ldots,s(s+1)(s+2)\}. \]

Thus the object asked about is the unordered simple 3-uniform hypergraph

\[P_3=\bigl\{\{1,2,3\},\{2,3,4\},\{3,4,5\}\bigr\}. \]

The word “unordered” matters: the displayed labels specify an isomorphism type, not an order that an embedding must preserve. The problem is to improve

\[\Omega\!\left(\frac{t^2}{\log t}\right) \le r_3(P_3,K_t^{(3)})\le O(t^2), \]

and in particular to decide whether the upper bound is \(o(t^2)\), perhaps even of order \(t^2/\log t\).

There is a convention shift in the literature. Mubayi--Suk write \(TP_m\) for the unordered tight 3-path on \(m\) vertices, with \(m-2\) edges. Consequently, the AIM object \(P_3\) is their \(TP_5\), while AIM \(P_2\) is their \(TP_4\). Ordered tight-path Ramsey numbers are a different problem and are not used here.

Equivalently, if \(H\) is the hypergraph of red triples in a red/blue coloring of \(K_N^{(3)}\), a blue \(K_t^{(3)}\) is exactly an independent \(t\)-set of \(H\). Hence \(r_3(P_3,K_t^{(3)})\) is the least \(N\) such that every \(N\)-vertex \(P_3\)-free 3-graph has independence number at least \(t\).

Can we find in polynomial time a graph $G=(V,{E})$ with a minimum number of edges such that $\lambda_{G_0+G}(x,y)\ge r(x,y)$ for every $x,y\in V$?

背景链接：https://oldlemon.cs.elte.hu/egres/open/List_of_open_problems

13671 | AIM-COMBINATORICS-0026

Local Hilbertian variance and obstructions to p-tightness

P / partially_solved | AIM 研讨会问题汇编

Let \(2\le p<\infty\), let \(A\subseteq B_p^d=\{x\in\mathbb R^d:\|x\|_p\le1\}\) be finite, and let \(a\in\operatorname{conv}(A)\). For every \(\varepsilon>0\), there are at most \(O(p\varepsilon^{-2})\) distinct points \(x_1,\ldots,x_s\in A\) and nonnegative weights \(\theta_i\) with \(\sum_i\theta_i=1\) such that \[\left\|a-\sum_{i=1}^s\theta_i x_i\right\|_p\le\varepsilon. \]

In particular, this preserves the phrases “unit Hamming ball,” the omitted approximation norm, and the trailing word `status`.

The phrase “the L^p unit Hamming ball” is not standard. A literal unit Hamming ball is a subset of a discrete alphabet such as \(\{0,1\}^d\), not a ball in \(\mathbb R^d\), and it has no parameter \(p\). By contrast, Barman's theorem and every subsequent primary source checked use the unit \(\ell_p\) ball and measure the approximation error in \(\ell_p\). The following is therefore a **strongly supported reconstruction**, not a verbatim recovery:

If “Hamming ball” were instead read literally as \(\{0,e_1,\ldots,e_d\}\), the problem would become a special simplex-approximation question and the asserted linear dependence on \(p\) would not describe its true behavior; Proposition 5.5 below quantifies this.

Local trees of triangles force quadratic order

S / solved | AIM 研讨会问题汇编

Question Does there exist any finite graph where every edge is in at least two triangles and the graph is locally a tree of triangles? (Solved by J. Verstraete)

(Nešetřil--Rödl) Partial results

Recovered problem. For every positive integer \(\ell\), find a finite nontrivial graph \(G\), of order \(n\geq\ell\), such that:

来源字段：https://www.overleaf.com/read/mnvcscjjysvg

13673 | AIM-COMBINATORICS-0056

Local triangle trees and K4-minor support girth

S / solved | AIM 研讨会问题汇编

For every positive integer \(\ell\), is there a finite graph \(G\) such that \(G\xrightarrow{2}K_3\) and, for every set \(X\subseteq V(G)\) of at most \(\ell\) vertices, the induced graph \(G[X]\) is a subgraph of a tree of triangles?

The record comes from the January 2015 AIM workshop *Graph Ramsey theory* and attributes the question to Vojtěch Rödl. In normalized notation it asks:

Here \(G\xrightarrow{2}K_3\) means that every red/blue coloring of \(E(G)\) has a monochromatic triangle.

The record also states the motivating converse phenomenon: for each fixed triangle tree \(T\), there is a number of colors \(k\) such that every \(G\xrightarrow{k}K_3\) contains \(T\). That assertion is background rather than an ingredient in the affirmative solution below.

The supplied record says that a tree of triangles starts with a triangle and is enlarged by adding two edges that make one new triangle with an existing edge. The official workshop summary makes the intended recursion fully explicit: at each step one adds **one fresh vertex** \(x\) and the two edges \(xa,xb\), where \(ab\) is an existing edge. Thus these graphs are exactly the graphs usually called **2-trees** (under the convention that the initial graph is \(K_3\)).

There are two quantifier and containment points to settle.

1. The phrase “on every \(\ell\) vertices” is interpreted locally, as “on every set of at most \(\ell\) vertices.” If it meant only sets of exactly \(\ell\) vertices with no requirement \(|V(G)|\ge \ell\), the assertion would become vacuous whenever the witness had fewer than \(\ell\) vertices. If \(|V(G)|\ge\ell\), the “exactly \(\ell\)” and “at most \(\ell\)” versions are equivalent because the class of subgraphs of 2-trees is hereditary. 2. The word “induces” applies to \(G[X]\): all edges of \(G\) within \(X\) are retained. The subsequent containment in a triangle tree is ordinary subgraph containment, not induced-subgraph containment. This is exactly the wording of the source and is the notion addressed below.

Isolated vertices and disconnected induced graphs cause no problem: a “subgraph” may delete vertices and edges from the ambient triangle tree.

13695 | AIM-COMBINATORICS-0199

Minimal feedback arc sets and long paths

S / solved | AIM 研讨会问题汇编

Conjecture 6.29 (Lichiardopol's Conjecture). Every digraph \(D\) has some minimal feedback arc set \(F\) which contains a path of length \(\delta_D^+\).

a feedback arc set immediately before the conjecture: if \(D=(V,E)\), then \(F\subseteq E\) is a feedback arc set (FAS) when \((V,E\setminus F)\) has no directed cycle. The exact statement is:

The source's note says that this conjecture implies the Hoàng--Reed, Caccetta--Häggkvist, Bermond--Thomassen, and Thomassé path conjectures.

The AIM text itself does not define “minimal.” The subsequent primary work of Schneider and Botler on this exact conjecture resolves the ambiguity:

- **minimal means inclusion-minimal**, not minimum cardinality: there is no FAS \(F'\subsetneq F\); - the path lies in the spanning arc-subdigraph \(D[F]=(V(D),F)\), so every arc of the path belongs to \(F\); this is not a vertex-induced subdigraph; - a path has distinct vertices \(v_0,\ldots,v_\ell\) and arcs \(v_iv_{i+1}\), and its length is its number \(\ell\) of arcs.

Their formulation says “length at least \(\delta^+(D)\).” This is equivalent to the AIM wording because a longer directed path has a subpath of exactly the required length.

There is a convention mismatch in the 2006 PDF. Its opening definition allows parallel directed edges, while later work on Conjecture 6.29 uses an arc set \(A\subseteq V\times V\), hence no parallel copies. Proposition 4 below shows that the literal multiplicity-degree multidigraph reading is already false in a particularly elementary way. More importantly, Theorem 3 gives a simple, loopless, digon-free counterexample, so the present-day refutation does not depend on this ambiguity.

Multiplicity and an exact weighted-cut identity for three-term progressions

P / partially_solved | AIM 研讨会问题汇编

Inspection of the official PDF confirms that the lost superscripts and fractions are \[\frac{n^2(1+o(1))}{22}\qquad\hbox{and}\qquad \frac{n^2}{16}. \] The words beginning “COLLECTED BY” are a page footer, not part of the problem. The source also says “Roberts-Zeilberger”; the cited paper is by Aaron Robertson and Doron Zeilberger.

Given a homogeneous linear system S that is partition regular for r colors, determine the least possible number of nontrivial monochromatic solutions in an r-coloring of $[n]=\{1,\ldots,n\}$. The list notes that for two colors and $x+y=z$ the answer is $n^2(1+o(1))/22$, whereas a random coloring gives asymptotically $n^2/16$. It asks in particular for $x+y=2z$, and whether random two-colorings are optimal.

For $x+y=z$, count triples with $x\le y$, so reversal of the summands is identified. There are \[U(n)=\sum_{z=2}^n\left\lfloor\frac z2\right\rfloor =\left\lfloor\frac{n^2}{4}\right\rfloor \] such triples. The $\lfloor n/2\rfloor$ cases $x=y$ have two distinct values and are monochromatic with probability $1/2$; all others have three distinct values and are monochromatic with probability $1/4$. Thus a random two-coloring has expectation \[\frac{U(n)-\lfloor n/2\rfloor}{4} +\frac{\lfloor n/2\rfloor}{2} =\frac{n^2}{16}+O(n). \] This is exactly the normalization in the AIM question. Counting ordered pairs (x,y) instead doubles the leading constants to $n^2/8$ randomly and $n^2/11$ optimally. Robertson--Zeilberger and Schoen proved the reversal-identified minimum $n^2/22+O(n)$.

For $x+y=2z$, this report counts each nonconstant three-term progression \[(a,a+d,a+2d),\qquad d>0,\quad a+2d\le n, \] once. In the equation, it corresponds to $(x,y,z)=(a,a+2d,a+d)$, with the reversal of x,y identified. Ordered endpoint solutions have twice the count. The diagonal $x=y=z$ is excluded as trivial; including it adds exactly n monochromatic solutions and changes no leading constant.

Off-diagonal convex geometric Ramsey bounds

P / partially_solved | AIM 研讨会问题汇编

Problem: Improve these bounds.

Recovered problem. For integers \(s,n\ge2\), improve the lower and upper bounds for the least integer \(g(s,n)\) such that every red/blue coloring of all pairs of every \(g(s,n)\)-point set in the plane in general position contains either

Its stored section, “Ordered Ramsey numbers,” is misleading because a section boundary was absorbed into the preceding record.

The AIM workshop summary independently describes the diagonal parameter: the least size of a general-position planar point set whose every red/blue pair-coloring contains a monochromatic convex \(p\)-set. More decisively, Mubayi and Suk's 2014 paper defines exactly this convex geometric Ramsey problem and gives the diagonal bound \[2^{\Omega(n)}<g(n,n)\le 2^{O(n^2\log n)}. \] Its concluding remarks state the same off-diagonal problem and the same direct Ramsey/Erdős--Szekeres upper-bound mechanism. The original Overleaf project was not directly retrievable, but the repository adjacency, the AIM workshop summary, and this primary paper agree. Thus the recovered problem is:

- \(s\) points in convex position whose every pair is red, or - \(n\) points in convex position whose every pair is blue.

Here “general position” means no three points are collinear. The order of the colors is immaterial, so \(g(s,n)=g(n,s)\).

The powers displayed in the source are coarse asymptotic bounds and should not be read as literal inequalities for every small \(n\). In particular, the standard Erdős--Szekeres lower bound is \(2^{k-2}+1\le ES(k)\), where \(ES(k)\) is defined below.

Optimal Minimal Dispersion in High Dimensions

P / partially_solved | Oberwolfach 报告问题汇编

For the minimal dispersion $\operatorname{disp}^*(n,d)$ of n points in $[0,1]^d$, can one improve $$ \operatorname{disp}^*(n,d)\leq\min\left\{\frac{c_1d}{n},\frac{c_2d\log(n/d)}{n}\right\}, $$ and in particular prove $\operatorname{disp}^*(n,d)\leq cd/n$ for $n\geq d$? Can one also improve $$ \operatorname{disp}^*(n,d)\geq\frac{\log_2d}{4(n+\log_2d)} $$?

13734 | AIM-COMBINATORICS-0233

Order lifting for sparse additive bases of polynomial values

P / partially_solved | AIM 研讨会问题汇编

This is Problem 2.8, attributed to T. Wooley, in the AIM workshop list *Recent trends in additive combinatorics*.

For a set $A\subseteq\mathbb N$, write

\[hA=\{a_1+\cdots+a_h:a_i\in A\},\qquad A(x)=|A\cap[0,x]|. \]

The question is: if $f\in\mathbb Z[t]$ has degree $d\ge 2$, takes natural-number values, and

\[\{f(1),f(2),\ldots\}\subseteq hA, \]

must $A(x)$ satisfy a substantially stronger lower bound than the counting bound $A(x)\gg x^{1/(hd)}$? As is customary for an asymptotic question, finitely many initial values of f are irrelevant. We therefore assume below that f is positive and strictly increasing on the range in use; a polynomial of positive leading coefficient has this property eventually.

Order-robust ordered Ramsey numbers of regular graphs

S / solved | AIM 研讨会问题汇编

Does there exist a constant \(c>0\) such that for every sufficiently large \(n\) there exists a 100-regular graph \(H\) on \(n\) vertices such that \(r_<(H)\ge n^{1+c}\) for every ordering of \(H\)?

The remainder of the extracted record starts with the literal command \[\texttt{\string\section\{Ramsey meets Erd\H{o}s--Szekeres\}} \] and introduces Dhruv Mubayi's function \(g(s,n)\). This is a source-boundary error, not part of Question 32. Thus this job treats only the 100-regular ordered-Ramsey question.

For an underlying graph \(H\) and a total order \(\prec\) on \(V(H)\), write \((H,\prec)\) for the resulting ordered graph. Its ordered Ramsey number \(r_<((H,\prec))\) is the least \(N\) such that every red-blue coloring of the edges of the naturally ordered complete graph on \([N]\) contains a monochromatic copy of \(H\) whose vertex embedding preserves \(\prec\).

The phrase "for every ordering" is inside the choice of \(H\). Equivalently, with \[\rho(H):=\min_{\prec}r_<((H,\prec)), \tag{1.1} \] the question is \[\exists c>0\ \exists n_0\ \forall n\ge n_0\ \exists\text{ a 100-regular }H_n\text{ on }n\text{ vertices with }\rho(H_n)\ge n^{1+c}. \tag{1.2} \]

13746 | AIM-COMBINATORICS-0021

Parity, polynomial rank, and an exact prime-distance case

P / partially_solved | AIM 研讨会问题汇编

There is an absolute constant C such that, for $0<\alpha<1$, if k is an even integer satisfying \[C\sqrt{n\log(1/\alpha)}\le k\le n-C\sqrt{n\log(1/\alpha)}, \] and $A\subseteq\mathbb F_2^n$ has no two distinct elements at Hamming distance k, then $|A|/2^n\le\alpha$.

This preserves the missing parity hypothesis and the ambiguous expression under the square root.

The `literature` field is empty.

The literal statement is not correct: k must be even. The standard parity subspace

\[E_n=\{x\in\mathbb F_2^n:|x|\equiv0\pmod2\} \]

has density $1/2$, and every element of $E_n+E_n=E_n$ has even Hamming weight. Thus it avoids every odd k.

There is a second, genuinely consequential ambiguity. The TeX string

\[\sqrt{\log \alpha^{-1}n} \]

could mean either $\sqrt{n\log(1/\alpha)}$ or $\sqrt{\log(n/\alpha)}$. The first reading is strongly supported by the AIM workshop summary: for forbidden distance $k=(1-\gamma)n$, it records the Frankl--Rödl bound

\[|A|\le (2-\Omega(\gamma^2))^n. \]

After division by 2^n, this is an $\exp(-\Omega(\gamma^2n))$ density bound, and solving for the endpoint gap $\gamma n=n-k$ gives the scale $\sqrt{n\log(1/\alpha)}$. It does not give $\sqrt{\log(n/\alpha)}$.

Accordingly, the following is the **strongly supported reconstruction**, not a claim that the missing typography has been recovered verbatim:

Here $A+A=\{x+y:x,y\in A\}$, addition is in $\mathbb F_2^n$, and $|z|$ is ordinary integer Hamming weight. Since $x+y=0$ exactly when $x=y$, the fact that $0\in A+A$ for every nonempty A is harmless when $k>0$. Density means $|A|/2^n$. The endpoint inequality makes the assertion vacuous when α is so small that the interval contains no integer.

Periodic Laplacian certificates for robustness and explosion

P / partially_solved | AIM 研讨会问题汇编

Lionel Levine: “Suppose I give you a stable, periodic sandpile configuration \(c\) on the square grid \(\mathbb Z^2\). Is it decidable whether there is an integer \(n\) such that \(c+n\delta_0\) (i.e. the addition of \(n\) grains of sand to the origin) is not stabilizable?”

The original AIM PDF, *Problems from the AIM Chip-Firing Workshop*, was checked directly. Problem 11 reads:

Matt Baker then asks what the set of such \(n\) looks like. Levine says that, if it is nonempty, it has a minimum. Andrea Sportiello asks whether that minimum must depend on the period, and Levine observes that a suitable period-dependent bound would make the problem decidable.

No mathematical text is missing.

The intended finite encoding is taken to be two positive periods \(P,Q\), followed by the \(PQ\) heights \(c(i,j)\in\{0,1,2,3\}\) in a rectangular fundamental cell. The declared periods need not be minimal. The decision question is uniform in this finite input.

13765 | AIM-COMBINATORICS-0062

Polynomial bounds for rectilinear knot Ramsey numbers

P / partially_solved | AIM 研讨会问题汇编

Question: Is it polynomial in k?

Lower bound: $n(K) \geq \sqrt{\nu(K)}$, where $\nu(K)$ is the crossing number of a knot.

We can also ask the same question for links. For the simplest nontrivial link of two unknots (i.e., Hopf link), the answer is 6.

The preceding record supplies the missing antecedents. A **linear** (or rectilinear) spatial embedding of K_n sends its vertices to points of $\mathbb R^3$ and every edge to the straight segment joining its endpoints, with distinct edges meeting only at common endpoints. For a knot or link type L, let $R(L)$ be the least n such that every linear embedding of K_n contains a cycle, or a vertex-disjoint union of cycles, equivalent to L. This is the quantity denoted $n(K)$ in the question. Negami's original equivalence permits an arbitrary homeomorphism of $\mathbb R^3$, and hence does not distinguish a chiral link from its mirror. He separately proves finiteness of the ambient-isotopy version $R^+(L)$.

The phrase “polynomial in k” needs a uniform quantifier. For knots define \[N_{=}(k)=\max_{c(K)=k}R(K),\qquad N_{\leq}(k)=\max_{c(K)\leq k}R(K), \] where $c(K)$ is crossing number. These maxima are finite because there are only finitely many knot types with bounded crossing number and Negami proved every $R(K)$ finite. The natural question is whether constants C,d, independent of K, satisfy \[R(K)\leq C(1+c(K))^d, \] equivalently whether $N_{\leq}(k)$ is polynomially bounded. Since \[N_{\leq}(k)=\max_{0\leq j\leq k}N_{=}(j), \] a uniform polynomial bound for either formulation yields one for the other (after replacing a bound by its monotone envelope).

13769 | AIM-COMBINATORICS-0009

Popular square differences: a radix obstruction and a sharp characteristic-two no-wrap model

P / partially_solved | AIM 研讨会问题汇编

Popular Furstenberg--Sárközy. For all $\epsilon>0$, there exists $N_0=N_0(\epsilon)$ such that for all $N\ge N_0$, if $A\subseteq[N]$ and $|A|\ge\delta N$, then there exists $y\ne0$ such that $$ |\{x:x,x+y^2\in A\}|\ge(\delta^2-\epsilon)N, $$ with $N_0(\epsilon)\le e^{1/\epsilon^c}$.

Its main paragraph reads:

It then asks for superpolynomial lower bounds on $N_0(\epsilon)$, or even $N_0(\epsilon)>\epsilon^{-10}$, and for upper or lower bounds over $\mathbb F_p[t]_{<n}$.

The displayed statement omits a quantifier on δ. The natural uniform reading is $$ \forall\epsilon>0\ \exists N_0(\epsilon)\ \forall N\ge N_0\ \forall\delta\in[0,1]\ \forall A\subseteq[N]\quad |A|\ge\delta N\Longrightarrow\cdots . \tag{1} $$ This is equivalent to replacing δ in the conclusion by the actual density $\alpha=|A|/N$: one direction takes $\delta=\alpha$, and the other uses $\delta\le\alpha$. This formulation makes it clear why the threshold can depend only on ϵ. The range $\delta^2\le\epsilon$ is trivial, since the requested lower bound is nonpositive.

Here y is an integer. Since y and $-y$ give the same shift, and since a positive count forces $y^2\le N-1$, the meaningful range is $$ 1\le y\le\lfloor\sqrt{N-1}\rfloor. \tag{2} $$ The variable x can be taken over $\mathbb Z$; membership of both terms in $A\subseteq[N]$ automatically imposes $1\le x\le N-y^2$. This report uses the non-strict inequalities in the AIM record. The known literature often proves a strict inequality, which is stronger. Our counterexamples also have a strict gap, so endpoint conventions do not affect them.

An arbitrary admissible N_0 can always be enlarged, so a lower-bound question is meaningful only for the least threshold. Define $$ \mathcal N_{\mathbb Z}(\epsilon) =\min\{N_*:\text{the actual-density version holds for every }N\ge N_*\}. \tag{3} $$ Existence follows from known optimal polynomial-recurrence results.

13770 | AIM-COMBINATORICS-0022

Popular-direction planarization for no-five-coplanar sumsets

P / partially_solved | AIM 研讨会问题汇编

Doubling of generic set of points

There is a result of Stancescu as follows: If $A\subset \mathbb{R}^2$ is a finite set with no three points on a line, then $$ |A+A|\geq |A|(\log |A|)^c $$ for some $c>0$. Also we know that the lower bound of $|A|^{1-\varepsilon}$ is false because of the Behrend construction. We would like to generalize this statement to higher dimensions.

Let $A\subset \mathbb{R}^3$ be a finite set with no five points on a plane. What is the best inequality $$ |A+A|\geq |A|f(A) $$ that we can have?

The exact AIM record says:

The source status says that $f(A)\geq\exp(\log^c|A|)$ is known, and that the Behrend construction does not imply $f(A)\leq|A|^c$.

The named author is Yonutz V. Stanchescu, not “Stancescu.” His 2002 paper proves, in particular, that if X is an m-point planar set with no three collinear, then $$ |X+X|\geq \frac12m \left(\frac{m}{r_3(m)}\right)^{1/4}, \tag{1.1} $$ where $r_3(N)$ is the largest size of a subset of $\{1,\ldots,N\}$ with no nontrivial three-term arithmetic progression.

The sentence about a false $|A|^{1-\varepsilon}$ lower bound can only refer to the factor $f(A)$. Read literally as a lower bound for $|A+A|$, it is weaker than the elementary torsion-free inequality $|A+A|\geq2|A|-1$. The intended assertion is that one cannot hope in the planar problem for $$ f(A)\geq |A|^{1-\varepsilon}, $$ or equivalently $|A+A|\geq|A|^{2-\varepsilon}$, because Stanchescu's Behrend-type construction has $$ |A+A|\leq |A|\exp(C\sqrt{\log |A|}) =|A|^{1+o(1)} $$ for arbitrarily large sizes.

In this report, “plane” means an affine plane and all points in a forbidden five-tuple are distinct. The condition allows four coplanar points and three collinear points. For $|A|\geq5$, however, it forbids four collinear points: a line containing four points, together with any fifth point, lies in an affine plane.

Quantifier-resolved off-diagonal semi-algebraic graph Ramsey numbers

P / partially_solved | AIM 研讨会问题汇编

Question: (Fox) Is \(R_f^{(2)}(3,n)=n^{1+o(1)}\)?

The preceding records introduce \(R_f^{(k)}(s,n)\) as the unbalanced version of a Ramsey problem for a semi-algebraic relation, with the superscript recording uniformity. They do not say whether \(f\) is fixed once and for all or ranges over all descriptions of bounded complexity. That distinction is decisive here.

For a fixed symmetric predicate \(f\) on \(\mathbb R^d\), define \[R_2^f(3,n)=\min\{N:\text{every }N\text{-point realization of }f\text{ contains a }K_3\text{ or an independent }n\text{-set}\}. \tag{1} \] If \(f\) is not symmetric, the nearby source convention evaluates \(f(p_i,p_j)\) for \(i<j\); then an ordering of the points is part of the structure. All new predicates used below are symmetric, so this issue does not affect the proofs.

Modern papers more often fix only a complexity tuple \(\mathbf t=(d,D,m)\). A graph has complexity \(\mathbf t\) if its vertices are points of \(\mathbb R^d\) and adjacency is a fixed Boolean combination of the signs of \(m\) polynomials, each of degree at most \(D\). Then \[R_2^{\mathbf t}(3,n) \tag{2} \] is the least \(N\) forcing the Ramsey alternative in **every** graph of that complexity. The polynomials and Boolean formula may vary between graphs, whereas \(d,D,m\) do not vary with \(n\). A third notion, used explicitly by Jin--Tomon, fixes the entire description \(\Lambda=(f_1,\ldots,f_m;\Phi)\) and writes \(R_2^\Lambda(3,n)\).

Thus (1), (2), and the fixed-description version are not interchangeable. A uniform theorem for (2) implies the corresponding upper bound for each fixed description in that class. A single lower-bound construction for (2) says nothing about another specified \(f\), unless its description is identified.

Finally, \(R(3,n)=n^{1+o(1)}\) is a two-sided assertion. For a class that contains the empty graph on \(n-1\) vertices, \(R(3,n)\geq n\) is automatic, so a bound \(R(3,n)\leq n(\log n)^C\) establishes it. For one fixed predicate, the lower bound \(n\) is not universal: if \(f\equiv1\), then \(R_2^f(3,n)=3\) for every \(n\geq3\).

13784 | AIM-COMBINATORICS-0013

Quantifier-sensitive random barriers for dense linear tripartite patterns

P / partially_solved | AIM 研讨会问题汇编

Turán exponents of hypergraphs. There exists \(c>0\) such that the following holds. If \(H\) is an \(n\)-vertex, 3-uniform hypergraph with at least \(n^{3-c/d}\) edges, then \(H\) contains some/every 3-uniform, 3-partite linear hypergraph on \(d\) vertices with at least \(d^2/100\) edges.

The AIM record reads:

The slash in "some/every" cannot be silently resolved: it separates two different extremal problems. To avoid using \(H\) both for a host and a pattern, write \(\mathcal G\) for the host, put \[k_d=\left\lceil\frac{d^2}{100}\right\rceil, \] and let \(\mathcal L_d\) be the finite family of isomorphism types of 3-uniform, 3-partite, linear hypergraphs on exactly \(d\) vertices with at least \(k_d\) edges. Isolated vertices are allowed under the usual meaning of "on \(d\) vertices"; none of the asymptotic results below depends on this convention.

With \(\operatorname{ex}_3(n,\mathcal F)\) denoting the maximum number of edges in an \(\mathcal F\)-free 3-graph, the two readings are:

* **Some:** \(\operatorname{ex}_3(n,\mathcal L_d)<n^{3-c/d}\). * **Every:** \(\max_{F\in\mathcal L_d}\operatorname{ex}_3(n,F)<n^{3-c/d}\).

Here "every" means that the host contains at least one copy of every isomorphism type \(F\); it does not mean that every labeled injection of \(F\) is present. The first extremal number is at most the minimum of the individual extremal numbers, whereas the second assertion is governed by their maximum.

The natural order of quantifiers is \[\exists c>0\ \forall d\geq d_0\ \exists n_0(d)\ \forall n\geq n_0(d) \ \forall\mathcal G. \tag{1} \] In particular, \(d\) is fixed before \(n\to\infty\), and \(c\) is absolute. Letting \(d>n\) without such an order makes containment impossible. Small \(d\) can be handled separately, so the choice of a fixed \(d_0\) is immaterial to the intended asymptotic question.

13792 | AIM-COMBINATORICS-0161

Rainbow reachability and the multi-label core obstruction

P / partially_solved | AIM 研讨会问题汇编

Conjecture 6.1 (Seymour, Sullivan). Let G be a simple digraph on vertex set V, and let $E_1,\ldots,E_k\subseteq E(G)$. Give an arc e the label set $S_e\subseteq\{1,\ldots,k\}$, where $i\in S_e$ if and only if $e\in E_i$, and put $G_i=(V,E_i)$. Then either

1. G contains a rainbow directed cycle; or 2. there is a vertex v such that \[\bigl|\{w:\text{there is a rainbow directed path of positive length from }v\text{ to }w\}\bigr| \geq \sum_{i=1}^k\delta^+_{G_i}(v). \]

The record comes from Blair D.

If each arc e has a label set $S_e\subseteq[k]$, a directed path or directed cycle is **rainbow** when one can choose a label $\ell(e)\in S_e$ for every one of its arcs so that the chosen labels are pairwise distinct. Thus labels are assigned to arcs of the structure; an arc may carry several available labels.

With the PDF's typography restored, the statement is:

The notation is nonstandard but unambiguous in the PDF: δ^+_G without an argument is minimum outdegree, while $\delta^+_G(v)$ is explicitly defined to be the outdegree of the particular vertex v. Thus the right side is $\sum_i d^+_{G_i}(v)$, not a sum of global minimum degrees.

The positive-length convention, and hence exclusion of v from its own reachability set, is forced by the document's stated implications. With $E_1=E_2=E(H)$, Conjecture 6.1 is claimed to imply Seymour's second-neighborhood conjecture exactly; including the trivial path would yield only $|N_2^+(v)|\geq |N^+(v)|-1$. Likewise, the document's deduction of Caccetta--Häggkvist uses the fact that the reachable set has size at most $|V|-1$.

Random Beck-Fiala systems and the hereditary saturation obstruction

P / partially_solved | AIM 研讨会问题汇编

Beck-Fiala for random set system. Each element $i\in[n]$ lies in t randomly selected sets from $\mathcal S$.

Its literature field says that when $m\ge n$ the hereditary discrepancy is $O(\sqrt{t\log t})$ with high probability, that when $n\ge m^t$ the hereditary discrepancy is $O(1)$, and asks about the remaining range $n^{1/t}<m<n$.

Their precise model is as follows. Let $X=[n]$ be the elements and let $\Sigma=\{S_1,\ldots,S_m\}$ be the sets, with $1\le t\le m$. Independently for every $x\in X$, choose a subset

$$ T_x\in\binom{[m]}t $$

uniformly among the $N=\binom mt$ possibilities, and put $x\in S_j$ exactly when $j\in T_x$. Equivalently, the $m\times n$ incidence matrix has independent columns, each uniform among the 0--1 vectors of Hamming weight exactly t.

Thus there is **no replacement within a column**: an element belongs to exactly t distinct sets. Columns are sampled **with replacement across elements**, and those column choices are independent. This is not the Bernoulli-entry model studied by Hoberg and Rothvoss [HR], where memberships are mutually independent with a prescribed probability.

Ezra--Lovett's first theorem is indeed hereditary. Their dense-regime theorem as actually stated in the paper is about ordinary discrepancy. The paper's abstract, and apparently the AIM synopsis copied from it, use “hereditary discrepancy” also for the dense regime, but Theorem 1.4/4 and its proof state only disc. The distinction is mathematically essential and is resolved below by an explicit obstruction.

Reciprocal constants and exact entropy-to-set bounds for easier arithmetic Kakeya

P / partially_solved | AIM 研讨会问题汇编

Let $S\subset\mathbb Z^n$ be such that for all $(d_1,\ldots,d_r)\in([N]^n)^r$, S contains, for some translate a_0, the generalized arithmetic progression $$\{a_0+i_1d_1+\cdots+i_rd_r: i_1,\ldots,i_r\in\{0,1,\ldots,k-1\}\}.$$ Then $|S|\geq N^{c_kn+o_{k\to\infty}(1)}$.

The supplied AIM record, Problem 2.5 in the “Additive combinatorics” section of *High-dimensional phenomena in discrete analysis*, states:

The record adds that $r=1$ is known with exponent “$0.59n+o_k(1)$,” and calls the following formulation equivalent: if integer-valued random variables $X,Y_1,\ldots,Y_r$ obey $$H(X+a_1Y_1+\cdots+a_rY_r)\leq h \quad\text{for all }a_j\in\{0,1,\ldots,k-1\},$$ then $H(Y_1,\ldots,Y_r)\leq rhc_k$.

Several details are not specified and cannot be silently filled in.

* The displayed $o_{k\to\infty}(1)$ does not say how N,n,r are quantified, is not multiplied by n, and uses k both in c_k and as the limiting variable. A precise asymptotic formulation should instead define a normalized exponent by a limit in N, and only then discuss its limit in k. * If the entropy multiplier is called c_k, its direct set consequence has exponent $1/c_k$, not c_k. Section 5 gives the exact calculation and a $k=2$ falsification of the same-symbol reading. * The entropy variables must be jointly defined. The standard primary sources assume that they are discrete and finitely supported; independence is not assumed. In the set-to-entropy application, the directions are chosen independently but X is a deterministic function of all of them. * The problem is nontrivial only for $k\geq2$. For $k=1$, every nonempty S works and the entropy hypothesis controls only $H(X)$. * The notation $[N]$ may mean $\{1,\ldots,N\}$ or $\{0,\ldots,N-1\}$. The proofs below use only $|[N]|=N$ and remain valid if zero is allowed. The source does not require the labeled directions to be distinct or linearly independent; neither do the proofs.

We therefore work with integers $k\geq2,r\geq1,n\geq1,N\geq1$, finite S, and all labeled direction tuples, including dependent or repeated ones.

来源字段：http://aimpl.org/highdimdiscrete/2/

13806 | AIM-COMBINATORICS-0194

Reciprocal-weight cycles and a winding-number obstruction

S / solved | AIM 研讨会问题汇编

Conjecture 6.24 (Zhang). Let \(G\) be a digraph on \(n\) vertices, and \(f:E(G)\to\{0,1,\ldots\}\). If \[\sum_{e\in E^+(v)} f(e)\ge \frac nk \qquad\text{for every }v\in V(G), \] then there is a directed cycle \(C\) such that \[\sum_{e\in C}\frac1{f(e)}\le k. \]

The source immediately prints Charbit's counterexample: take the directed Cayley graph on \(\mathbb Z_8\) with generators \(\{1,2\}\), put weight \(1\) on the arcs \(x\to x+2\), weight \(2\) on the arcs \(x\to x+1\), and take \(k=3\).

Two defects in the printed text require explicit treatment.

1. The codomain includes zero although \(1/f(e)\) is then undefined. The most direct repair is \(f:E(G)\to\mathbb Z_{>0}\). Equivalently, one may set \(1/0=+\infty\); Lemma 1 below explains why zero-weight arcs can then simply be deleted. 2. The source says that the outgoing-weight sum in Charbit's example is \(4\). There is one outgoing 1-arc of weight \(2\) and one outgoing 2-arc of weight \(1\), so the correct sum is \[2+1=3, \] not \(4\). This is an arithmetic typo, not a fatal error, since \(3\ge8/3\).

The source does not state the domain of \(k\). The Caccetta--Haggkvist context indicates a positive integer, and all counterexamples below use integers \(k\ge2\). The sharp-threshold calculation also makes sense for real \(k>0\).

Primary source: Blair D. Sullivan, *A Summary of Problems and Results related to the Caccetta--Haggkvist Conjecture* (2006), arXiv:math/0605646, Section 6.6, Conjecture 6.24.

Regular-matroid Jacobian sampling is solved; torsion obstructs the unrestricted simplicial version

P / partially_solved | AIM 研讨会问题汇编

This is Problem 2 in the problem list from the July 8--12, 2013 AIM workshop *Generalizations of chip-firing and the critical group*. The source PDF is the authoritative text [AIM13].

The mathematically precise reconstruction is as follows. Let

\[D\in \mathbb Z^{n\times m},\qquad \operatorname{rank}D=n, \qquad L=DD^{\mathsf T}, \]

\[J(D)=\mathbb Z^n/L\mathbb Z^n=\operatorname{coker}(L). \]

Suppose one can choose a uniformly random element of $J(D)$. Can one use it to choose a uniformly random column basis of D, efficiently? The discussion proposes regular matroids as the correct first generalization of graphs, observes via Cauchy--Binet that the cardinalities agree in the unimodular case, and asks for an efficient bijection. The final sentence says that it should suffice that the determinants of the maximal minors are ±1.

There is an important literal-versus-intended distinction in that last sentence.

- If **every** maximal minor is literally ±1, then no maximal minor vanishes, every n-subset of columns is a basis, and uniform sampling is just uniform sampling of an n-subset. - The nontrivial regular-matroid reading is that every **nonzero** maximal minor is ±1, equivalently every maximal minor belongs to $\{0,\pm1\}$. This report calls that condition *maximal-minor unimodularity*.

The source's phrase “the size of a basis” in part (a) is likewise understood as “the number of bases.”

13816 | AIM-COMBINATORICS-0005

Restricted Roth progressions and their local obstructions

P / partially_solved | AIM 研讨会问题汇编

Roth with common difference \(p-1\). For all \(C>0\) and sufficiently large \(N\), if \(A\subset[N]\) with \(|A|\ge N/\log^C N\), then there exist \(x\) and \(p\) prime such that \[x,x+p-1,x+2(p-1)\in A. \]

Its exact main statement is:

The record asks separately what happens if \(p-1\) is replaced by a positive integer that is a sum of two squares. It also proposes a model: for \[W=\prod_{q\le w,\ q\ {\rm prime}}q, \qquad S_W=\{y\ge1:(y,W)=1\}, \] find \(x,x+y,x+2y\in A\) with \(y\in S_W\).

The main quantifiers are \[\forall C>0\ \exists N_0(C)\ \forall N\ge N_0(C)\ \forall A\subset[N]. \] Thus \(C\) is fixed before \(N\to\infty\); the assertion is not uniform for a choice \(C=C(N)\). Containment forces \(1\le p-1\le (N-1)/2\), hence \(2\le p\le (N+1)/2\). The literal statement allows \(p=2\), which asks for three consecutive elements of \(A\). No lower bound tending to infinity is imposed on \(p\).

For the sum-of-two-squares variant, this report uses the standard convention \(y=u^2+v^2>0\) with \(u,v\in\mathbb Z\), not both zero. The periodic result below remains true even if both coordinates are required nonzero.

13821 | AIM-COMBINATORICS-0168

Rigidity of the deficit-one rainbow-cycle obstruction

P / partially_solved | AIM 研讨会问题汇编

Conjecture 6.5 (Seymour). Under the hypotheses of Conjecture 6.1, if \(|V|=d\) and \[\sum_{i=1}^{k} d^+_{G_i}(v)\ge d \] for all \(v\), then \(G\) must have a rainbow cycle.

Note. This conjecture is false if \(|V|=d\) is replaced by \(|V|=d+1\).

(Seymour) Under the hypotheses of". Reading the two records against page 6 of the source PDF recovers the complete statement:

The searchable PDF text suppresses the superscript \(+\) in the displayed formula for Conjecture 6.5. The intended quantity is nevertheless the outdegree: Conjecture 6.1 uses \(d^+_{G_i}(v)\), the source's opening notation defines \(\delta^+_{G_i}(v)\) as the outdegree of \(v\), and Conjecture 6.9 repeats the total-outdegree condition with an explicit \(+\). We use the modern notation \(d^+\) to avoid confusing a vertex degree with minimum degree.

The hypotheses inherited from Conjecture 6.1 are as follows. A finite simple digraph \(G=(V,E)\) is supplied with edge sets \(E_1,\ldots,E_k\subseteq E\), and \(G_i=(V,E_i)\). Equivalently, every arc \(e\) has a list \[S_e=\{i\in[k]:e\in E_i\}. \] A directed cycle is *rainbow* if one can choose from the list of each of its arcs a different label. In the sharpness note, the same integer \(d\) remains on the right-hand side while the number of vertices is changed from \(d\) to \(d+1\).

This attempt owns only the continuation and sharpness note in record 0168. It uses record 0167 only to recover the broken sentence and does not edit or claim that record.

Sequence defined on multisets

S / solved | Open Problem Garden

Conjecture Define a $2 \times n$ array of positive integers where the first row consists of some distinct positive integers arranged in increasing order, and the second row consists of any positive integers in any order. Create a new array where the first row consists of all the integers that occur in the first array, arranged in increasing order, and the second row consists of their multiplicities. Repeat the process. For example, starting with the array $[1; 1]$, the sequence is: $[1; 1]$-> $[1; 2]$-> $[1, 2; 1, 1]$-> $[1, 2; 3, 1]$-> $[1, 2, 3; 2, 1, 1]$-> $[1, 2, 3; 3, 2, 1]$-> $[1, 2, 3; 2, 2, 2]$-> $[1, 2, 3; 1, 4, 1]$-> $[1, 2, 3, 4; 3, 1, 1, 1]$-> $[1, 2, 3, 4; 4, 1, 2, 1]$-> $[1, 2, 3, 4; 3, 2, 1, 2]$-> $[1, 2, 3, 4; 2, 3, 2, 1]$, and we now have a fixed point (loop of one array).

The process always results in a loop of 1, 2, or 3 arrays.

13850 | AIM-COMBINATORICS-0010

Sharp Sidorenko and finite embedding bounds for 3-uniform loose forests

P / partially_solved | AIM 研讨会问题汇编

How badly can Sidorenko fail for hypergraphs. Let \(H\) be a 3-uniform, 3-partite hypergraph. Then any \(n\)-vertex 3-uniform hypergraph with \(pn^3\) edges contains at least \(p^{C e(H)}n^{v(H)}\) copies of \(H\).

The AIM record asks:

The accompanying note says that, when \(H\) is contained in \(K_{t,t,t}^{(3)}\), one has the exponent \(t^3\), and compares this with the graph exponent \(e(H)+v(H)/2\).

There are three necessary clarifications.

1. The quantity \(p=e(G)/n^3\) is not the usual ordered edge density. For a simple 3-graph \(G\), put \[\rho=t_{K_3^{(3)}}(G)=\frac{6e(G)}{n^3}=6p. \] If \(q=e(G)/\binom n3\) is the usual unordered density, then \(\rho=q(n)_3/n^3\). In particular the source's \(p\) is at most \(1/6\), up to the finite-\(n\) correction. 2. A universal assertion is meaningful only if \(C\) is an absolute constant, independent of \(H\). If \(C\) may depend on \(H\), the complete-partite envelope already gives such a bound. 3. The word "copies" cannot literally mean injective copies for every positive \(p\). More precisely, for every fixed simple \(H\) with at least two edges, every finite \(C\), and every \(n\geq v(H)\), let \(G\) consist of one edge and \(n-3\) isolated vertices. Then \(p=n^{-3}>0\), the claimed right side \(p^{Ce(H)}n^{v(H)}\) is strictly positive, but \(\operatorname{inj}(H,G)=0\). The density formulation naturally counts labeled homomorphisms; injective copies follow only above a finite-size threshold, with a collision error.

Accordingly, the normalized form of the open question is whether an absolute \(C\) satisfies \[t_H(G):=\frac{\operatorname{hom}(H,G)}{n^{v(H)}} \geq \rho^{C e(H)} \tag{1} \] for every 3-partite 3-uniform \(H\) and every finite simple 3-graph \(G\).

Sharp threshold and finite torsion certificates for torus difference sets

S / solved | AIM 研讨会问题汇编

Let \(a>0\). Is there a \(d_0=d_0(a)\) such that, if \(d>d_0\) and \(A\subset \mathbb T^d\) is closed with \(\mu(A)>a\), then \(A-A\) contains a subgroup?

Here \(\mathbb T^d=(\mathbb R/\mathbb Z)^d\) and \(\mu\) is normalized Haar measure. Literally, every difference set contains the trivial subgroup \(\{0\}\), so the only nonvacuous reading is “contains an infinite subgroup.” This is also the reading forced by the accompanying AIM remark, which says that Bourgain's examples have difference sets containing no *infinite* subgroup. Green's later formulation asks whether \(A-A\) contains a one-dimensional subgroup.

For a closed \(A\), these formulations are equivalent: \(A-A\) is compact, and if it contains an infinite abstract subgroup \(H\), it contains \(\overline H\). An infinite closed subgroup of a torus has positive-dimensional identity component and hence contains a circle subgroup \[C_v:=\{tv\pmod {\mathbb Z^d}:t\in\mathbb R/\mathbb Z\} \] for some primitive \(v\in\mathbb Z^d\setminus\{0\}\). Conversely a circle is infinite. Finite nontrivial subgroups are not what the recovered problem asks about.

Simplex Ramsey numbers and a robust boundary-extension lemma

P / partially_solved | AIM 研讨会问题汇编

Estimate $r_k(k+1):=r_k(k+1,k+1)$.

For positive integers $s,t>k$, $r_k(s,t)$ is the least N such that every red-blue coloring of $\binom{[N]}k$ contains either an s-set all of whose k-subsets are red or a t-set all of whose k-subsets are blue. Thus $$ r_k(k+1):=r_k(k+1,k+1) $$ is the least N for which every two-coloring of the k-edges of $K_N^{(k)}$ contains a monochromatic $K_{k+1}^{(k)}$.

The complete k-graph $K_{k+1}^{(k)}$ consists of the $k+1$ facets of an abstract k-simplex, explaining the section title. There is no notation ambiguity in the record. The parameter tending to infinity is the uniformity k, while the desired monochromatic set has the minimum nontrivial size $k+1$.

The source’s stated lower bound $2^{\Omega(k)}$ was correct when recorded but is no longer current.

13863 | AIM-COMBINATORICS-0209

Sliding progression-free windows via gap words

P / partially_solved | AIM 研讨会问题汇编

Problem 1.3 (G. Freiman). Fix an integer $s\geq3$ and suppose that $A=(a_1,a_2,\ldots)$ is a strictly increasing sequence of integers such that no segment $$ (a_{i+1},a_{i+2},\ldots,a_{i+s})\qquad(i=0,1,\ldots) $$ contains a three-term arithmetic progression. How large can the density of A be? Describe all extremal sets.

It gives two examples:

1. for $s=4$, the nonnegative integers in the residue classes $0,1,3,4\pmod 6$, of density $2/3$; 2. for $s=8$, the nonnegative integers in the residue classes $0,1,3,4,9,10,12,13\pmod {18}$, of density $4/9$.

The source fixes several conventions implicitly rather than explicitly.

- The examples are subsets of the nonnegative integers, but the statement says only “integers.” Since an increasing one-sided sequence is bounded below by a_1, translating it makes it nonnegative and does not change any density or arithmetic-progression condition. - A three-term progression is necessarily **nontrivial**, with three distinct terms $x<y<z$ satisfying $x+z=2y$. Otherwise every nonempty block would contain a trivial progression. - Every sliding block of **exactly** s consecutive sequence terms is meant, including the first block because $i=0$. A shorter collection of consecutive terms is automatically covered by extending it to an s-term block. - “Density” is not defined. For an arbitrary set the natural density need not exist. This report therefore optimizes the upper asymptotic density $$ \overline d(A)=\limsup_{N\to\infty} \frac{|A\cap[0,N]|}{N+1}. \tag{1.1} $$ When the natural density exists, it agrees with this value. Both examples are periodic and have natural density.

The two displayed moduli are redundant but correct: $$ \{0,1,3,4\}\pmod6=\{0,1\}\pmod3, $$ and $$ \{0,1,3,4,9,10,12,13\}\pmod {18} =\{0,1,3,4\}\pmod9. $$

Small doubling, tripling, and balanced quotients below two

S / solved | AIM 研讨会问题汇编

Problem 3.5 (T. Tao). Let \(A\) be a finite subset of a (not necessarily abelian) group. Given that \(A\cdot A\) is small, is \(A\cdot A\cdot A\) necessarily small, too?

It then records that Ben Green and Mei-Chu Chang pointed out the counterexample template \(A=H\cup\{x\}\), with \(H\) non-normal and \(x\) outside its normalizer. The source proposes two replacements:

1. Does \(A\) contain a large subset \(A'\) for which \((A')^3\) is small? 2. What inverse information follows from \(|A^2|<2|A|\)?

Here and below, “small” is interpreted uniformly: \(|A^2|\le K|A|\) for a fixed \(K\), and the desired bounds depend only on \(K\).

13871 | AIM-COMBINATORICS-0208

Sparse relative hypergraph regularity and its necessary hypotheses

P / partially_solved | AIM 研讨会问题汇编

This is Problem 1.2, attributed to T. Tao, in the AIM workshop list *Recent trends in additive combinatorics* (collected by Ernie Croot and Vsevolod F. Lev). It asks whether a subset of large relative density in a pseudorandom sparse hypergraph satisfies a hypergraph regularity lemma, and observes that such a result could reprove the existence of arbitrarily long arithmetic progressions in the primes.

\[|A|=|B|=N,\qquad G_0\subseteq A\times B, \]

G_0 is “sparsely $c(\varepsilon,\delta)$-quasirandom,” and $G\subseteq G_0$ has $|G|>\delta|G_0|$, then there are equitable partitions

\[A=A_1\cup\cdots\cup A_s,\qquad B=B_1\cup\cdots\cup B_t, \]

with $s,t<C(\varepsilon,\delta)$, such that G is ε-regular relative to G_0 on at least $(1-\varepsilon)st$ pairs $A_i\times B_j$.

More importantly, the source does not formally define “sparsely quasirandom” or the desired hypergraph regularity. The literal question is therefore not one fully quantified proposition: the answer depends on the pseudorandomness hypothesis and on whether “regularity” is required merely to decompose an edge function or also to support a counting/removal lemma.

The presenter remarks that, despite the difficulty of dense hypergraph regularity, the correct sparse induction might be cleaner.

Sparse witnesses and off-diagonal van der Waerden numbers

P / partially_solved | AIM 研讨会问题汇编

Question: Does $W(n)-W^*(n)\to\infty$?

Off diagonal van der Waerden numbers $W(k,3)$

From computed values, $W(k,3)$ seems to grow quadratically in k.

Known: $k^{2-o(1)}<W(k)<e^{O(k\log^5 k)}$.

Here $W(n)$ is the least N such that every two-colouring of $[N]$ has a monochromatic n-term arithmetic progression, while $W^*(n)$ is the least cardinality of an arbitrary finite set $S\subset\mathbb Z$ such that every two-colouring of S has such a progression. It also records $W^*(3)=W(3)=9$ and $W^*(4)\le 27<35=W(4)$.

1. Is the saving from allowing an arbitrary set unbounded, i.e. $W(n)-W^*(n)\to\infty$? 2. Does the off-diagonal number $W(k,3)$ have quadratic order?

In the last displayed bound of the record, the occurrence of $W(k)$ is almost certainly a transcription error for $W(k,3)$. All conclusions below use this explicitly labelled reconstruction.

Stanley's Positivity Problems in Algebraic Combinatorics - Problem 1: Generalized Lower Bound Theorem and g-theorem for Gorenstein* complexes

S / solved | AMR 问题清单汇编

Let Δ be a $(d-1)$-dimensional Gorenstein* simplicial complex (i.e., for every face $F\in\Delta$, including $F=\varnothing$, the reduced simplicial homology $\tilde{H}_i(\operatorname{link}(F);\mathbb{Q})$ is $\mathbb{Q}$ if $i=\dim\operatorname{link}(F)$ and 0 otherwise), with f-vector $(f_0,\dots,f_{d-1})$ and h-vector $(h_0,h_1,\dots,h_d)$ defined by $\sum_{i=0}^d f_{i-1}(x-1)^{d-i}=\sum_{i=0}^d h_i x^{d-i}$. Does the Generalized Lower Bound Theorem $h_0\le h_1\le \cdots \le h_{\lfloor d/2\rfloor}$ (or more generally McMullen's g-theorem) hold for Gorenstein* complexes (and in particular for triangulations of spheres, PL-spheres, and complete simplicial fans)?

13940 | AIM-COMBINATORICS-0281

The balanced-graph trichotomy for C4-free and subcubic graphs

P / partially_solved | AIM 研讨会问题汇编

Conjecture 1 (Conforti, Cornuéjols, Rao). Every balanced graph is either basic or has a 2-join or a skew-partition.

- A graph is **balanced** if every induced cycle has length divisible by \(4\). Such a graph is bipartite. - A balanced graph is **basic** if either: 1. it admits a bipartition with every vertex on one side of degree at most \(2\); or 2. it has a hole \(H\) such that \(G\setminus V(H)\) induces a complete bipartite graph. - A **2-join** has a partition \(V(G)=X_1\dot\cup X_2\), with disjoint nonempty \(A_i,B_i\subseteq X_i\) for \(i=1,2\), such that all \(A_1A_2\) and all \(B_1B_2\) edges are present and there are no other edges between \(X_1\) and \(X_2\). Each \(G[X_i]\) contains an \(A_i\)-to-\(B_i\) path. Under the corrected standard convention, if \(|A_i|=|B_i|=1\), then \(G[X_i]\) is not itself a chordless path between them. This is the proper/non-path convention intended by the source; later authors note and repair a minor wording error in an older printed definition. - A **skew partition** is a partition into four nonempty sets \((A,B,C,D)\) such that \(A\) is anticomplete to \(B\) and \(C\) is complete to \(D\). Nonemptiness is necessary: allowing empty pieces would make the decomposition statement vacuous.

Here and below, graphs are finite and simple. A \(C_4\) means an induced four-cycle.

The DFS-burning solution and a chordwise Hamilton-path refinement

P / partially_solved | AIM 研讨会问题汇编

Is there a natural bijection \(\phi\) between labeled trees \(T\) on \(\{0,1,2,\ldots,n\}\), rooted at \(0\), and parking functions of length \(n\), such that \[\deg(\phi(T))=g-\operatorname{inv}(T), \] where \(g\) is the genus of the complete graph \(K_{n+1}\) and \(\operatorname{inv}(T)\) is the number of inversions of \(T\)? Perkinson further suggested that an arbitrary-graph version should replace inversions by Gessel's \(\kappa\)-statistic.

Comparison with the linked AIM PDF recovers the question as follows:

Here \[g=|E(K_{n+1})|-|V(K_{n+1})|+1=\binom n2. \] The recorder's note says that the problem was resolved in reference [30]. In the bibliography of the AIM document, [30] is David Perkinson, Qiaoyu Yang, and Kuai Yu, *G-parking functions and tree inversions*, arXiv:1309.2201, subsequently published in *Combinatorica* 37 (2017), 269--282.

The Erdős-Hajnal property for the Paley seven-vertex tournament with one vertex removed

S / solved | AIM 研讨会问题汇编

Does the six-vertex tournament with backward arcs \((4,1),(6,3),(6,1),(5,2)\) have the tournament Erdős--Hajnal property?

Its historical remark says that Berger--Choromanski--Chudnovsky had reduced the six-vertex case to this one tournament.

The extraction split the definition of \(T^*\) into the preceding record and also incorrectly retained the preceding section title, "Online Ramsey numbers." The nearby source text reconstructs the intended section as **Erdős--Hajnal for tournaments**, attributed to Maria Chudnovsky, and defines \(T^*\) on \(\{1,\ldots,6\}\) by the four exceptional arcs \[6\to1,\qquad 6\to3,\qquad 5\to2,\qquad 4\to1, \] with every remaining pair oriented \(i\to j\) when \(i<j\).

Thus the exact recovered question is:

The Euclidean Steinitz conjecture and a sharp ell_1 obstruction

P / partially_solved | AIM 研讨会问题汇编

The AIM record is Problem 1.4, “Steinitz conjecture,” from the workshop list *Hereditary discrepancy and factorization norms*. Its displayed text says that, for zero-sum vectors \(v_1,\ldots,v_n\in\mathbb R^d\) of norm at most one in a norm \(X\), \[\min_{\pi}\max_{1\le k\le n} \left\|\sum_{i=1}^k v_{\pi(i)}\right\|_X =O(\sqrt d), \] after taking a supremum over \(n\). As written, this is not a consistent definition or conjecture:

1. the displayed \(S_n(X,d)\) omits the supremum over admissible vector families, so it still depends on the particular family just introduced; 2. \(S^n\) should be the symmetric group on \([n]\), conventionally denoted \(\mathfrak S_n\); 3. an \(O(\sqrt d)\) estimate uniform over all norms is false; and 4. the record itself reports a linear lower bound for \(\ell_p\), \(1<p<2\), which would contradict the displayed conjecture.

For a finite indexed family \(V=(v_1,\ldots,v_n)\), put \[c_X(V):=\min_{\pi\in\mathfrak S_n}\max_{1\le k\le n} \left\|\sum_{i=1}^k v_{\pi(i)}\right\|_X, \] and \[S_{X,n}(d):= \sup_{\substack{v_1,\ldots,v_n\in\mathbb R^d\\ \sum_i v_i=0,\ \|v_i\|_X\le1}} c_X(V), \qquad S_X(d):=\sup_{n\ge1}S_{X,n}(d). \] For \(X=\ell_p^d\), write \(S_p(d)\).

The **recovered intended conjecture** is \[S_2(d)=O(\sqrt d), \tag{EC} \] with a universal implied constant. This is the Euclidean Steinitz problem, also attributed to Bergström in the modern literature. Current primary sources explicitly formulate the conjecture for \(\ell_2\), while describing the \(O(d)\) bound as the result for arbitrary norms. Thus the word “a norm \(X\)” in the AIM formulation has almost certainly been carried over from the definition when the conjectural sentence should have specialized to \(X=\ell_2\).

The AIM line “if \(X=\ell_p\) for \(1<p<2\), \(S(X,d)=\Omega(d)\)” is also corrupt under the definition above. The most plausible repair is \(\Omega(d^{1/p})\), but the record supplies no citation for that line, so this report treats the exponent repair as a reconstruction rather than as a verified bibliographic fact. The theorem below proves the \(\Omega(d^{1/p})\) lower bound directly.

13949 | AIM-COMBINATORICS-0174

The exact two-label boundary for directed rainbow cycles

P / partially_solved | AIM 研讨会问题汇编

Conjecture 6.1, if $\delta^+_{G_i}\geq r_i$, and $\sum_{i=1}^{t}r_i\geq |V|$, there is a rainbow cycle in G.

Conjecture 6.8 (recovered). If numbers $r_1,\ldots,r_k$ satisfy \[\delta^+(G_i)\geq r_i\quad(i\in[k]), \qquad \sum_{i=1}^k r_i\geq n:=|V|, \tag{1.3} \] then G contains a rainbow directed cycle.

Its literal text is

The preceding record contains “Conjecture 6.8. Under the hypotheses of”. The original AIM PDF and arXiv source verify that the intended statement is therefore Conjecture 6.8, continuing the setup of Conjecture 6.1. The printed source uses k layers in Conjecture 6.1 but sums to t in Conjecture 6.8. The coherent reconstruction treats this as a dummy-index mismatch and sets $t=k$.

Let $G=(V,E)$ be a finite simple digraph, let $E_1,\ldots,E_k\subseteq E(G)$, and put \[S_e=\{i\in[k]:e\in E_i\},\qquad G_i=(V,E_i). \tag{1.1} \] The source defines “simple” to mean that there is at most one arc from u to v; it does not build looplessness or the absence of digons into that word. A rainbow directed path or cycle is one whose arcs admit a labeling \[\ell:E(H)\longrightarrow[k],\qquad \ell(e)\in S_e, \tag{1.2} \] such that ℓ is injective. Thus a multiply labeled arc uses one chosen admissible label, and the two arcs of a rainbow digon must receive different labels.

For completeness, Conjecture 6.1 says that either there is a rainbow directed cycle or some vertex v can reach at least $\sum_i d^+_{G_i}(v)$ vertices by rainbow paths. The intended paths there have positive length: the source's proof of an implication uses the fact that, without a rainbow cycle, a vertex cannot reach all n vertices in this sense, while Conjecture 6.10 later explicitly says “possibly trivial” when it wishes to include length zero. Accordingly, the start vertex is **not** included in the Conjecture 6.1 reachable set merely via the trivial path. If one instead allows the trivial path, it has no arcs, is vacuously rainbow, and includes its start; that alternative convention does not affect Conjecture 6.8 or any theorem below.

13950 | AIM-COMBINATORICS-0050

The exceptional three-color path problem: star-forest and triangle-density reductions

P / partially_solved | AIM 研讨会问题汇编

Is it true that every three-edge-coloring of every graph of chromatic number at least six contains a monochromatic path of length three?

that \(P_k\) means a path of **length** \(k\), hence with \(k\) edges. It records \[r(P_3,P_3,P_3)=6 \] and asks:

To avoid a clash with the more usual convention in the literature, this report writes \[Q=v_0v_1v_2v_3 \] for the path with three edges and four vertices. Thus the source's \(P_3\) is the graph called \(P_4\) by Garrison and most of the cited papers.

The intended setting is finite simple graphs and ordinary, not necessarily induced, copies of the path. Garrison explicitly works with finite simple graphs, and both the Ramsey statement and the use of the Turán number are for ordinary subgraphs. A three-edge-coloring may leave a color unused. The host may be disconnected, but its chromatic number is the maximum of the chromatic numbers of its components, so this causes no extra case.

Equivalently, if \(\chi(Q,3)\) denotes the smallest \(m\) such that every three-edge-coloring of every \(m\)-chromatic graph contains a monochromatic \(Q\), the question asks whether \[\chi(Q,3)=R_3(Q)=6. \]

13961 | AIM-COMBINATORICS-0049

The minimal empty-core tight path and the 2026 uniformity-four resolution

P / partially_solved | AIM 研讨会问题汇编

Is it true that for fixed k, and s sufficiently large (in terms of k), one has \[r_k(P_s^{(k)},K_t^{(k)})=\Theta(t^{k-1})? \]

1. $P_s^{(k)}$ has **s edges**, not s vertices. Explicitly, \[V(P_s^{(k)})=[s+k-1],\qquad E_i=\{i,i+1,\ldots,i+k-1\}\quad(1\le i\le s). \] 2. The Ramsey problem is **unordered**. Thus a copy is an ordinary hypergraph copy; its vertices need not respect an ambient linear order.

For fixed integers $k\ge2$ and $s\ge1$, $r_k(P_s^{(k)},K_t^{(k)})$ is the least N such that every red/blue coloring of $\binom{[N]}k$ contains either a red ordinary copy of $P_s^{(k)}$ or a blue $K_t^{(k)}$. Equivalently, if the red edges form a k-graph H, it is the least N for which every $P_s^{(k)}$-free H on N vertices satisfies $\alpha(H)\ge t$. All asymptotics below are for $t\to\infty$, with constants allowed to depend on the fixed pair (k,s).

This differs from the ordered tight-path notation in Mubayi--Suk: their $P_s^{(k)}$ has s ordered vertices and $s-k+1$ edges, and embeddings preserve the order. Their tower-type ordered results do not answer this AIM question.

13964 | AIM-COMBINATORICS-0206

The prime maximal Z15 boundary counterexample

S / solved | AIM 研讨会问题汇编

Conjecture 6.36 (Thomassé). Let \(G\) be a digraph on \(n\) vertices with minimum outdegree at least \(4n/15\) so that \(G\) is maximal with no cycles of length at most three, and has no homogeneous set (in other words, \(G\) cannot be obtained by substitution). Then \(G\) is a Cayley graph on \(3k+1\) vertices with \(1,\ldots,k\) as generators for some \(k\) (i.e. the circular interval graph with everyone joined to the next \(k\) clockwise).

Sullivan's 2006 AIM report. It prints the following statement:

It immediately adds:

The heading “Acknowledgements” begins on the next printed line.

Under the standard conventions made explicit below, the note and the conjecture are in direct tension. This report proves that the noted \(\mathbb Z_{15}\) digraph satisfies **every** printed hypothesis, including arc-maximality and absence of a nontrivial homogeneous set. Since \(15\neq3k+1\) for every integer \(k\), it refutes the literal statement. The likely repair is to replace “at least” by “strictly greater than,” but no claim is made here that the repaired conjecture is true.

13966 | AIM-COMBINATORICS-0003

The Renyi-Shannon bottleneck in entropic inverse arguments

P / partially_solved | AIM 研讨会问题汇编

Neighbor 1.1 states the entropic Polynomial Freiman-Ruzsa theorem with constant 11, confirming that Problem 1.3 asks for a more direct entropic derivation of inverse consequences, not for a proof of PFR itself.

The source asks about two assertions for \[f:\mathbb F_2^n\longrightarrow\mathbb F_2^m. \]

First, if \[\mathbb P_{x+y=z+w}\bigl(f(x)+f(y)=f(z)+f(w)\bigr)\geq\epsilon, \tag{1} \] PFR implies correlation with a linear function. Second, with \[D_hf(x)=f(x+h)-f(x), \] if \[\mathbb P_{x,h_1,h_2,h_3} \bigl(D_{h_1}D_{h_2}D_{h_3}f(x)=0\bigr)\geq\epsilon, \tag{2} \] PFR implies correlation with a quadratic function. It asks for direct entropic proofs with polynomial bounds.

Several conventions are absent and must be made explicit.

1. In (1), this report interprets the subscript as the uniform distribution on ordered quadruples satisfying \(x+y=z+w\). Equivalently, choose \(x,y,z\) independently and uniformly and put \(w=x+y+z\). 2. In (2), \(x,h_1,h_2,h_3\) are independent and uniform. 3. In characteristic two, subtraction equals addition: \[D_hf(x)=f(x+h)+f(x). \] Thus the third derivative is the sum of the eight cube values, and derivative order is immaterial. 4. The source never defines “correlates.” For vector-valued functions, two inequivalent meanings occur in the literature: - **agreement:** \(\mathbb P_x(f(x)=q(x))\) is at least a polynomial in the test parameter; - **scalar phase correlation:** for some nonzero output character \(\lambda\), the phase \((-1)^{\langle\lambda,f(x)\rangle}\) has nontrivial inner product with a linear or quadratic phase.

The PFR/approximate-homomorphism formulation naturally gives agreement with an affine map on a large set, while the standard \(U^3\) inverse theorem gives scalar phase correlation. These should not be conflated. “Linear” is also naturally affine in (1), since its test is invariant under adding a constant. A quadratic map here means a map of combinatorial degree at most two, equivalently one whose third additive derivatives vanish identically.

来源字段：http://aimpl.org/highdimdiscrete/1/

13967 | AIM-COMBINATORICS-0163

The repeated-label reduction and its sharp threshold

P / partially_solved | AIM 研讨会问题汇编

For a digraph \(H\), take \(G=H\), \(k=\lceil n/\delta_H^+\rceil\), and \(E_1=\cdots=E_k=E(H)\). We must get a rainbow cycle because the sum of the outdegrees at each vertex is at least \(n\). This corresponds to a directed cycle of length at most \(\lceil n/\delta_H^+\rceil\) in \(H\), as desired.

Here \(H\) is a finite simple oriented graph on \(n\) vertices and \(\delta_H^+\geq 1\).

For completeness, the preceding rainbow conjecture gives every arc \(e\) a label list \(S_e\subseteq [k]\), equivalently \(E_i=\{e:i\in S_e\}\), and says that either:

1. there is a directed cycle whose arcs can be assigned pairwise distinct admissible labels; or 2. some vertex \(v\) can reach at least \(\sum_i d^+_{G_i}(v)\) vertices by rainbow paths.

The source's deduction requires “reachable” in the second alternative to mean reachable by a positive-length rainbow path (or, equivalently for this argument, to exclude \(v\) itself when no rainbow cycle exists). Section 8 records what changes under the convention that the trivial path counts.

13968 | AIM-COMBINATORICS-0157

The sparse-removal conjecture fails literally and at the true extremal exponent

S / solved | AIM 研讨会问题汇编

Let F be a graph and $\alpha>1$ be such that $\operatorname{ex}(n,F)=\Omega(n^\alpha)$. Then for any $\epsilon>0$ there is n_0 so that if $n>n_0$ and a graph H is the edge-disjoint union of $m=\lceil\epsilon n^\alpha\rceil$ copies of F, then H contains another copy of F (i.e. has at least $m+1$ copies of F).

The AIM record (Hypergraph Turan problem workshop, Section “Ruzsa--Szemerédi Theorem and Relatives,” item 44.3) reads:

The stored source has one evident TeX error: `\Omega(n^{\alpha}$` is missing the closing brace after α. The display above repairs only that brace. In what follows:

- F and H are finite simple graphs, F is fixed, and H has exactly n vertices (isolated vertices of H are permitted); - “copy” means an unlabelled, not necessarily induced, subgraph isomorphic to F; - the hypothesis supplies a specified family of m pairwise edge-disjoint copies whose edge sets partition $E(H)$; and - “another” means a copy distinct from those specified m copies. It need not be edge-disjoint from them.

Counting labelled embeddings would make the numerical phrase “at least $m+1$ copies” inappropriate, since one image of F generally has several labelled embeddings. The unlabelled-image convention is the standard one here.

Tight 5-cycle minus an edge: solved density and a recursive deficit identity

P / partially_solved | AIM 研讨会问题汇编

Conjecture (Tight 5-cycle minus an edge). Let the 3-uniform hypergraph C_5^- be obtained from the tight 5-cycle C_5^3 by removing one edge. An example of a C_5^--free 3-graph can be obtained by taking a complete 3-partite 3-graph and repeating this construction recursively within each of the three parts, giving edge density $1/4$ in the limit. Prove that the Turán density $\pi(C_5^-) = \lim_{n \to \infty} \operatorname{ex}(n, C_5^-) / \binom{n}{3}$ satisfies $\pi(C_5^-) = 1/4$.

13976 | AIM-COMBINATORICS-0187

Trace equivalence and a triple-overlap obstruction

P / partially_solved | AIM 研讨会问题汇编

Conjecture 6.17. The following were all presented by Seymour, with no other attributions given. For the following questions, matrices are assumed to be $(n\times n)$ (0)-(1) matrices such that $(a_{ij}=1)$ implies $(a_{ji}\ne1)$, and all diagonal elements equal (1).

The original AIM PDF verifies that the fragment is actually **items 3 and 4 of Conjecture 6.17**, in Section 6.3, “Matrices.” The stray definition of spectral radius and terminal “8” belong to the transition to Conjecture 6.18, not to this problem.

The following source text is verified directly from page 8 of the PDF.

Item 2, immediately preceding the assigned fragment, supplies the shared quantitative hypotheses: $$ A_1,\ldots,A_t,\qquad \text{row sums of }A_i\text{ at least }r_i+1,\qquad \sum_{i=1}^t r_i\ge n, \tag{1.1} $$ and asks whether $$ \operatorname{tr}(A_1A_2\cdots A_t)>n. \tag{1.2} $$ The source explicitly says that this is equivalent to Conjecture 6.5.

Item 3 forms $(t+1)$ copies of the common vertex set (V), puts horizontal edges between equal vertices in consecutive copies, and puts the (A_k)-edges between copies (k) and $(k+1)$. It asks for a nonhorizontal path from the first copy of some (u) to the last copy of the same (u). Item 4 squashes the layers onto (V), colors an edge from layer (k) by (k), and asks for a nontrivial rainbow directed cycle whose colors appear in increasing order.

The diagonal (1)'s are the horizontal waiting steps. Put $$ B_i=A_i-I,\qquad E_i=\{(u,v):u\ne v,\ (B_i)_{uv}=1\}. \tag{1.3} $$ Then (B_i) is a zero-diagonal (0)-(1) matrix, every (E_i) is an oriented edge set, and $$ \delta^+(E_i)\ge r_i. \tag{1.4} $$ The wording of item 3 can be read as adding a matrix diagonal edge on top of the already specified horizontal edge. Whether those coincident edges are viewed as one edge or two does not affect the existence question. The matrix model counts the diagonal choice once, and that is the convention used here.

An “increasing” colored cycle means that one can choose a cyclic starting vertex so that the distinct colors encountered along the directed traversal are $$ i_1<i_2<\cdots<i_s. \tag{1.5} $$ This is exactly the convention forced by the layered construction.

Trimer Covers in the Triangular Grid - Problem 15

O / open | AMR 问题清单汇编

Is $T_{113}(n,2n-4)$ 2-adically continuous as a function of $n \geq 5$?

Comment: The sequence appears to be constant mod 2, constant mod 4, 2-periodic mod 8, and 8-periodic mod 16 (with repeating pattern 4, 4, 4, 4, 4, 12, 4, 12). The case $n = 4$ breaks the pattern. See OEIS entry A364416 (https://oeis.org/A364416).

背景链接：https://arxiv.org/abs/2206.06472

13986 | AMR-123-0008

Trimer Covers in the Triangular Grid - Problem 16

O / open | AMR 问题清单汇编

Is $T_{113}(n,2n-3)$ 2-adically continuous as a function of $n \geq 4$?

Comment: The sequence appears to be constant mod 2, constant mod 4, 2-periodic mod 8, and 8-periodic mod 16 (with repeating pattern 2, 14, 2, 14, 10, 6, 10, 6). The case $n = 3$ breaks the pattern. See OEIS entry A364417 (https://oeis.org/A364417).

At the OPAC 2022 meeting, David Speyer suggested that one might use a different definition of a trimer, namely, a path consisting of three vertices and two edges. Thus, each stone would correspond to three different trimers according to which 2 of the 3 possible edges one used. Equivalently, one could use the original definition of a trimer, with the proviso that each stone will count with weight 3. The new numbers do not satisfy any nice patterns, with one exception: in the case where all prototiles are allowed, using stones of weight 3 seems to give rise to the same 2-adic continuity phenomenon we saw in Problems 11 and 12.

Let $T_{ijk}(a,b;3)$ denote the weighted sum of the i,j,k tilings of the (a,b)-benzel as defined near the end of section 1,

where a tiling with m stones has weight 3^m.

背景链接：https://arxiv.org/abs/2206.06472

Trimer Covers in the Triangular Grid - Problem 18

O / open | AMR 问题清单汇编

Comment: The sequence appears to be constant mod 2, constant mod 4, constant mod 8, and 8-periodic mod 16 (with repeating pattern 4, 4, 12, 12, 4, 12, 12, 4). The case $n = 4$ breaks the pattern. See OEIS entry A364418 (https://oeis.org/A364418).

Is $T_{113}(n,2n-3;3)$ 2-adically continuous as a function of $n \geq 4$?

Comment: The sequence appears to be constant mod 2, constant mod 4, 2-periodic mod 8, and 8-periodic mod 16 (with repeating pattern 14, 6, 10, 2, 6, 14, 2, 10). The case $n = 3$ breaks the pattern. See OEIS entry A364438 (https://oeis.org/A364438).

Comment: Given that the number of right stones minus the number of left stones in a tiling of a benzel is the same for all tilings of that benzel, a different way to describe the weighting assigned to tilings in Problems 17 and 18 (equivalent up to a power of 3) is to give weight 1 to left stones and weight 9 to right stones. During the final stages of preparing this article for publication, I realized that one could more generally give weight 1 to left stones and weight m to right stones. The resulting enumerations appear to exhibit p-adic continuity when $m+1$ is a power of the prime p. Other forms of congruential consistency appear in the data as well; for instance, the data for $m=9$ appear to satisfy 5-adic continuity. I hope to address such patterns in future work.

13989 | AMR-123-0011

Trimer Covers in the Triangular Grid - Problem 20

O / open | AMR 问题清单汇编

The question we ask is, how many such tiling are there? OEIS entry A334875 (https://oeis.org/A334875) gives the answers for small values of n. If we look at the prime factorizations of the answers, we notice that the exponent of the prime 2 is creeping upward. Specifically, the multiplicity of the prime 2 in the factorizations of the nonzero terms in this sequence goes 0, 0, 1, 3, 2, 3, 4, 3, 4, 3, 5, 8, 6, 8, \dots. This is a priori surprising, since the probability that a ``random'' positive integer is divisible by 2^m decreases exponentially as m increases.

As n goes to infinity within the set of natural numbers congruent to 0, 2, 9, or 11 (mod 12), does the number of tiling of T_n by stones converge 2-adically to 0?

Uniform color bounds for avoiding three-point collinear configurations

P / partially_solved | AIM 研讨会问题汇编

Known: If \(T\) is a set of 3 collinear points, then there exists a 16-coloring of \(\mathbb E^N\) with no monochromatic copy of \(T\).

Recovered question. Determine \(q_*\). In particular, can the uniform upper bound \(q_*\leq16\) be reduced?

The immediately preceding record, AIM-COMBINATORICS-0085, ends with:

The next record begins the unrelated section on Folkman graphs. Thus “above” refers to the constant 16, not to the preceding conjectures about arbitrary plane triples. This reading is independently confirmed by the historical formulation of Erdős and Graham and by Graham--Tressler: for every three-point collinear set and in every dimension there is a 16-coloring avoiding a monochromatic congruent copy, and the question is whether 16 is the best universal constant.

Here is a precise formulation. For a nondegenerate three-point collinear set \(T\), let \[\chi_n(T)=\min\{q:\mathbb E^n\text{ has a coloring with at most }q\text{ colors and no monochromatic congruent copy of }T\}. \] Define \[q_*:=\sup_{T}\sup_{n\geq 1}\chi_n(T), \] where \(T\) ranges over triples of distinct collinear points. The recovered question is:

The coloring may depend on \(T\) and \(n\); only its number of colors must be uniform. No measurability or other regularity is imposed. A “copy” means a congruent copy, so its scale is fixed. Degenerate triples with repeated points are excluded.

For a permutation class C, does a uniformly random permutation of size n in C always converge to a limiting permuton, and what is the analogue of this question for graphons? Also, which polynomial functional equations of the form $$P\bigl(F(t,u),F(t,0),\partial_uF(t,0),t,u\bigr)=0$$ force the formal power series $F(t,u)$ to be algebraic under natural hypotheses? More generally, when a series $F(t,u,v)$ satisfies a polynomial relation involving $F(t,u,v)$, auxiliary series $G_i(t,u)$, and series $H_j(t)$, what natural hypotheses guarantee that F is algebraic?

14020 | AIM-COMBINATORICS-0088

van der Waerden numbers and sparse forcing sets

P / partially_solved | AIM 研讨会问题汇编

The source record, attributed to Ron Graham, defines \(W(n,m)\) to be the least \(N\) such that every red/blue coloring of \([N]=\{1,\ldots,N\}\) contains either a red \(n\)-term arithmetic progression or a blue \(m\)-term arithmetic progression, and puts \(W(n)=W(n,n)\). It records

\[W(2)=3,\quad W(3)=9,\quad W(4)=35,\quad W(5)=178,\quad W(6)=1132, \]

Berlekamp's lower bound \(W(p+1)\ge p2^p\) for prime \(p\), Gowers's upper bound

\[W(n)\le 2^{2^{2^{2^{2^{n+9}}}}}, \]

and Graham's prize conjecture

\[\boxed{W(n)\le 2^{n^2}}. \]

It also defines \(W^*(n)\) as the minimum cardinality of a finite set \(S\subset\mathbb N\) such that every two-coloring of \(S\) contains a monochromatic \(n\)-term arithmetic progression. It records \(W^*(3)=W(3)=9\) and \(W^*(4)\le27<W(4)=35\).

Throughout, an arithmetic progression is \(a,a+d,\ldots,a+(n-1)d\) with \(d>0\), so its terms are distinct. The source's damaged tabular markup was reconstructed only as the displayed list of exact values above. Translating a finite subset of \(\mathbb Z\) into \(\mathbb N\) preserves its progressions, so the variants using \(S\subset\mathbb Z\) and \(S\subset\mathbb N\) have the same parameter.

What a 2-join block must remember for perfect contractility

O / open | AIM 研讨会问题汇编

Conjecture. 2-Join decomposition is \(\mathcal C^{pc}\)-preserving.

Here \(\mathcal C^{pc}\) is the class of perfectly contractile graphs. The preceding text in the AIM source defines a 2-join as a partition \(V(G)=V_1\dot\cup V_2\) with pairwise disjoint nonempty sets \(A_i,B_i\subseteq V_i\) such that:

1. all edges between the two sides are precisely the edges of the complete joins \(A_1\)--\(A_2\) and \(B_1\)--\(B_2\); and 2. if \(\mathcal P_i\) is the family of chordless \(A_i\)--\(B_i\) paths in \(G[V_i]\) whose internal vertices avoid \(A_i\cup B_i\), then \(\mathcal P_i\ne\varnothing\), and \(G[V_i]\) is not isomorphic to a member of \(\mathcal P_i\).

The last condition excludes a path side, in terminology used by later 2-join literature.

* **Extraction defect.** After the displayed 2-join conjecture it absorbs a different star-cutset conjecture, Sections F.5 and F.6, and Sections G.1--G.4. The next canonical record starts with a conjecture from G.4. Those later paragraphs are not qualifications of the 2-join conjecture. * **Statement defect.** The source explains abstractly that blocks are formed by adding vertices and edges, but never specifies the blocks for this 2-join. Thus “the 2-join decomposition” is not a defined operation in this record. The opening conjecture has a clear research intent but no literal truth value until a block convention is fixed.

The mathematical work below concerns only the exact opening conjecture. It does not treat the unrelated material accidentally merged into the record.

What the critical group sees of a harmonic action

O / open | AIM 研讨会问题汇编

“If you have a graph with a harmonic action, then its critical group comes with some extra structure, namely a group of automorphisms of the graph. That extra object might be worth studying.”

This is item (41), attributed to Lionel Levine, in the AIM workshop list *Generalizations of chip-firing and the critical group*:

There is no missing formula and no question mark to reconstruct. The item is a research suggestion rather than a proposition or a question with fixed quantifiers. The precise object suggested by the remark is the finite \(\mathbb Z[G]\)-module \(\operatorname{Jac}(X)\), where \(G\) acts harmonically on \(X\) and hence acts on degree-zero divisors and their quotient by principal divisors.

There is one important correction to a literal reading of “a group of automorphisms”: a faithful action on the graph need not induce a faithful action on its critical group. Thus the extra datum is a representation \[\rho_X:G\longrightarrow \operatorname{Aut}(\operatorname{Jac}(X)), \] together with its kernel, not automatically an embedded copy of \(G\).

14093 | OPG-34908

Book Thickness of Subdivisions

P / partially_solved | Open Problem Garden

Let G be a finite undirected simple graph.

A k-page book embedding of G consists of a linear order $\preceq$ of $V(G)$ and a (non-proper) k-colouring of $E(G)$ such that edges with the same colour do not cross with respect to $\preceq$. That is, if $v\prec x\prec w\prec y$ for some edges $vw,xy\in E(G)$, then vw and xy receive distinct colours.

One can think that the vertices are placed along the spine of a book, and the edges are drawn without crossings on the pages of the book.

The book thickness of G, denoted by bt (G) is the minimum integer k for which there is a k-page book embedding of G.

Let G' be the graph obtained by subdividing each edge of G exactly once.

Conjecture There is a function f such that for every graph G, $$\text{bt}(G) \leq f(\text{bt}(G'))\enspace.$$

Circular choosability of planar graphs

P / partially_solved | Open Problem Garden

Let $G = (V, E)$ be a graph. If p and q are two integers, a (p,q)-colouring of G is a function c from V to $\{0,\dots,p-1\}$ such that $q \le |c(u)-c(v)| \le p-q$ for each edge $uv\in E$. Given a list assignment L of G, i.e.~a mapping that assigns to every vertex v a set of non-negative integers, an L-colouring of G is a mapping $c: V \to N$ such that $c(v)\in L(v)$ for every $v\in V$. A list assignment L is a t- (p,q)-list-assignment if $L(v) \subseteq \{0,\dots,p-1\}$ and $|L(v)| \ge tq$ for each vertex $v \in V$. Given such a list assignment L, the graph G is (p,q)- L-colourable if there exists a (p,q)- L-colouring c, i.e. c is both a (p,q)-colouring and an L-colouring. For any real number $t \ge 1$, the graph G is t- (p,q)-choosable if it is (p,q)- L-colourable for every t- (p,q)-list-assignment L. Last, G is circularly t-choosable if it is t- (p,q)-choosable for any p, q. The circular choosability (or circular list chromatic number or circular choice number) of G is $$cch(G):= \inf\{t \ge 1: G \text{ is circularly$t$-choosable}\}.$$

Circular flow numbers of r-graphs

P / partially_solved | Open Problem Garden

A nowhere-zero r-flow $(D(G),\phi)$ on G is an orientation D of G together with a function ϕ from the edge set of G into the real numbers such that $1 \leq |\phi(e)| \leq r-1$, for all $e \in E(G)$, and $\sum_{e \in E^+(v)}\phi(e) = \sum_{e \in E^-(v)}\phi(e), \textrm{ for all } v \in V(G)$.

A $(2t+1)$-regular graph G is a $(2t+1)$-graph if $|\partial_G(X)| \geq 2t+1$ for every $X \subseteq V(G)$ with $|X|$ odd.

Conjecture Let $t > 1$ be an integer. If G is a $(2t+1)$-graph, then $F_c(G) \leq 2 + \frac{2}{t}$.

Erdős Problem #84

P / partially_solved | Erdős 问题

The cycle set of a graph G on n vertices is a set $A\subseteq \{3,\ldots,n\}$ such that there is a cycle in G of length ℓ if and only if $\ell \in A$. Let $f(n)$ count the number of possible such A.

Prove that $f(n)=o(2^n)$.

Prove that $f(n)/2^{n/2}\to \infty$.

For any simple digraph G, we let $\gamma(G)$ be the number of unordered pairs of nonadjacent vertices (i.e. the number of non-edges), and $\beta(G)$ be the size of the smallest feedback edge set.

Conjecture If G is a simple digraph without directed cycles of length ≤ 3, then $\beta(G) \le \frac{1}{2} \gamma(G)$.

Queue-Number of Planar Graphs

S / solved | AMR 问题清单汇编

Does every planar graph have $O(1)$ queue-number? A queue layout of a graph consists of a linear order of the vertices and a partition of the edges into non-nested queues. Edge xy is nested inside edge vw if $v<x<y<w$ in the linear order. The queue-number of a graph G is the minimum number of queues in a queue layout of G. This question amounts to asking whether every planar graph has a vertex ordering with a constant number of pairwise nested edges (called a rainbow).

Topology and Limits in the Asymptotic Spectrum of Graphs

O / open | Oberwolfach 报告问题汇编

For finite graphs, let Δ be the compact space of graph parameters f satisfying

$$f(G\sqcup H)=f(G)+f(H),\qquad f(G\boxtimes H)=f(G)f(H),$$

monotonicity under cohomomorphisms, and $f(K_1)=1$. Is Δ connected? Does some $f\in\Delta$ satisfy $f(C_7)=\Theta(C_7)$? As primes $p\to\infty$, do the Haemers bounds satisfy

$$h_{\mathbb F_p}^*\longrightarrow h_{\mathbb Q}^*,\qquad h_{\mathbb F_p}\longrightarrow h_{\mathbb Q}?$$

Finally, if $C_{k,n}$ is the circular graph on the vertices of the n-cycle in which two vertices are adjacent exactly when their cyclic distance is less than k, are the functions $n/k\mapsto\Theta(C_{k,n})$ and $n/k\mapsto\vartheta(C_{k,n})$ continuous?

来源字段：https://doi.org/10.4171/owr/2018/50

15117 | OPG-815

Total Colouring Conjecture

P / partially_solved | Open Problem Garden

Conjecture A total coloring of a graph $G = (V,E)$ is an assignment of colors to the vertices and the edges of G such that every pair of adjacent vertices, every pair of adjacent edges and every vertex and incident edge pair, receive different colors. The total chromatic number of a graph G, $\chi"(G)$, equals the minimum number of colors needed in a total coloring of G. It is an old conjecture of Behzad that for every graph G, the total chromatic number equals the maximum degree of a vertex in G, $\Delta(G)$ plus one or two. In other words, $$ \chi"(G)=\Delta(G)+1\ \ or\ \ \Delta(G)+2. $$

We say that a set $P \subseteq {\mathbb R}^2$ is n-universal if every n vertex planar graph can be drawn in the plane so that each vertex maps to a distinct point in P, and all edges are (non-intersecting) straight line segments.

Question Does there exist an n-universal set of size $O(n)$?

Vertex Coloring of graph fractional powers

P / partially_solved | Open Problem Garden

Conjecture Let G be a graph and k be a positive integer. The $k-$ power of G, denoted by G^k, is defined on the vertex set $V(G)$, by connecting any two distinct vertices x and y with distance at most k. In other words, $E(G^k)=\{xy:1\leq d_G(x,y)\leq k\}$. Also $k-$ subdivision of G, denoted by $G^\frac{1}{k}$, is constructed by replacing each edge ij of G with a path of length k. Note that for $k=1$, we have $G^\frac{1}{1}=G^1=G$. Now we can define the fractional power of a graph as follows: Let G be a graph and $m,n\in \mathbb{N}$. The graph $G^{\frac{m}{n}}$ is defined by the $m-$ power of the $n-$ subdivision of G. In other words $G^{\frac{m}{n}}\isdef (G^{\frac{1}{n}})^m$. Conjecture. Let G be a connected graph with $\Delta(G)\geq3$ and m be a positive integer greater than 1. Then for any positive integer $n>m$, we have $\chi(G^{\frac{m}{n}})=\omega(G^\frac{m}{n})$. In [1], it was shown that this conjecture is true in some special cases.

All three above problems are open for segment visibility graphs. Only characterization known is for a sub-class given by Everette et al. [ehkn-cgta2-2000]. They have characterized those segment visibility graphs that do not have K_5 (a complete graph of five vertices) as a minor. A graph M is called a *minor* of a graph G if M can be obtained from G by a sequence of vertex deletions, edge deletions and edge contractions. Their characterization gives a straightforward polynomial time algorithm for recognizing this class of graphs.

Given a graph G in adjacency matrix form, determine whether G is the segment visibility graph of a set of disjoint segments S in the plane.

Let us consider variations of bar visibility graphs. While representing vertices of G as bars, there is no restriction on the length of horizontal bars. Suppose, a restriction is imposed that all bars in a visibility representation must have the same length. In that case, we get another type of visibility graphs which are known as *unit bar visibility graphs*. Though there are characterizations for special classes of unit bar visibility graphs [chks-cbvt-2006,dgh-unvl-2004,dv-ubvg-2003], no characterization is known for general graphs. We have the following problems.

Unlike bar visibility graphs, bar k-visibility graphs have not been completely characterized. For understanding this class of graphs, Dean et al. [deglst-bvg-2007] considered the problem of bounding the number of edges of a bar k-visibility graph G. They proved an upper bounds of $(k+1)(3n-7/2 k-5)-1$ edges for G and conjectured an improve edge bound of $(k+1)(3n-4 k-6)$ which was proved later by Hartke et al. [hvw-frbvg-2007]. They also studied d-regular k-visibility graphs. Dean et al. [deglst-bvg-2007] also proved that $6k+6$ is an upper bound on the chromatic number of G. We have the following problems [deglst-bvg-2007,hvw-frbvg-2007].

Dean et al. [deglst-bvg-2007] also studied the thickness of bar k-visibility graphs. The *thickness* of a graph G is defined as the minimum number of planar graphs whose union is G. Exact values of thickness is know for very few classes of graphs [mos-tgs-1998]. Dean et al. proved an upper bound of 4 for the thickness of bar 1-visibility graphs, and conjectured that bar 1-visibility graphs actually have thickness of at most 2. The conjecture was disproved by Felsner and Massow [fw-tbvg-2007] by constructing a bar 1-visibility graph having thickness 3. For a special class of bar 1-visibility graphs, Felsner and Massow [fw-tbvg-2007] presented an algorithm for partitioning the edges into two planar graphs showing that the thickness of this special class of graphs is 2. We have the following problems [deglst-bvg-2007].

It has been shown that the thickness of a bar k-visibility graph is bounded by $2k(9k-1)$. Can this upper bound be improved?

Visibility Graphs of Points, Segments and Polygons - Problem 29

O / open | AMR 问题清单汇编

Bar visibility graphs have been generalized to rectangle visibility graphs by considering both vertical and horizonal visibility among bars having non-zero thickness [bdhs-orvg-1997,dh-rvrbp-1997,o-opcv-1998,r-drvg-1997,sw-rvgc-2003] . A graph G is called a *rectangle visibility graph* if it can be realized by closed isothetic rectangles in the plane, with pairwise disjoint interiors, with vertices representing rectangles in such a way that two vertices v_i and v_j of G are connected by an edge if and only if their corresponding rectangles are vertically or horizontally visible from each other by a beam of unobstructed visibility of finite width. Unlike bar visibility graphs, no characterization of rectangle visibility graphs are known, and moreover, Shermer [s-orvsiii-1996] has shown that the problem of recognizing them is NP-complete. We have the following problem.

Characterize rectangle visibility graphs.

A *clique* in a graph is a set of pairwise adjacent vertices. The problem of computing the maximum clique in the visibility graph is not known to be NP-hard. Observe that the maximum clique in a visibility graph corresponds to the largest empty convex polygon inside the corresponding polygon. Algorithms for computing largest empty convex polygons has been reported by several authors [ar-clec-85, deo-secp-90, es-mcmcpvg-00]. However, for each of these algorithms, the input is either a polygon [es-mcmcpvg-00] or a point set [ar-clec-85, deo-secp-90]. Spinrad [s-grep-03] has discussed possible approaches for computing maximum clique using the notion of *triangle-extendible ordering* which is essentially a transitive orientation of the graph.

Given a visibility graph G in adjacency matrix form, compute a maximum clique of G.

Visibility Graphs of Points, Segments and Polygons - Problem 41

O / open | AMR 问题清单汇编

Although the most natural form of representation for visibility graphs would be to use coordinates of the points, this is not useful if we are looking for a space efficient representation. Lin and Skiena [ls-cavg-95] have proved that visibility graphs require endpoints to have exponential sized integers. However, it is not known whether singly exponential sized integers are sufficient. It is important because if we could guarantee that the number of bits in the integer is polynomial, then visibility graph recognition is in NP [s-grep-03].

Can all endpoints of a visibility graph be assigned integer coordinates such that the integers use a polynomial number of bits?

Let us discuss upper bounds on $b(n)$. It is obvious that $b(n) \leq {n \choose 2}$. Let $\mu(P)$ denote the size of the set of midpoints of all ${n \choose 2}$ segments between points of P. Let $\mu(n)$ denote the minimum of $\mu(P)$ for all P having n points with no three points being collinear. Using Freiman's theorem on set addition [f-fsts-1973], Stanchescu [ys-psc-2002] and Pach [p-msip-2003] have independently shown that $b(n) \leq \mu(n) \leq n2^{c \sqrt{\log n}}$, where c is an absolute constant. This shows that if $ \mu(n)$ is not $O(n)$, it can only be slightly super-linear. Many authors [dpt-nbvp-2009,hhuz-mpp-2001, m-bvpg-2009,pw-ovb-2010,ys-psc-2002] have stated or conjectured that every set of points P in general position requires a super-linear number of blockers as given below.

Prove that as $n \rightarrow \infty$, $\frac{b(n)}{n} \rightarrow \infty$.

Visibility Graphs of Points, Segments and Polygons - Problem 7

O / open | AMR 问题清单汇编

Consider the problem of obstacle representation of a given graph G of n vertices, which was introduced by Alpet et al. [akl-ong-2010]. Draw every vertex v_i of G as a point p_i in the plane and draw obstacles in such a way that every segment p_ip_j intersects an obstacle if and only if (v_i,v_j) is not an edge in G. The *obstacle number* of G is the minimum number of obstacles required in any obstacle representation of G. Since an obstacle can be placed to block the visibility between each pair of points, $n \choose 2$ is an upper bound on the obstacle number of G. We have the following question from Alpet et al. [akl-ong-2010].

Is the obstacle number of a graph with n vertices bounded above by a linear function of n?

What is the smallest number of disjoint spanning trees made a graph Hamiltonian

S / solved | Open Problem Garden

We are given a complete simple undirected weighted graph $G_1=(V,E)$ and its first arbitrary shortest spanning tree $T_1=(V,E_1)$. We define the next graph $G_2=(V,E\setminus E_1)$ and find on G_2 the second arbitrary shortest spanning tree $T_2=(V,E_2)$. We continue similarly by finding $T_3=(V,E_3)$ on $G_3=(V,E\setminus \cup_{i=1}^{2}E_i)$, etc. Let k be the smallest number of disjoint shortest spanning trees as defined above and let $T^{k}=(V,\cup_{i=1}^{k}E_i)$ be the graph obtained as union of all k disjoint trees.

Question 1. What is the smallest number of disjoint spanning trees creates a graph T^{k} containing a Hamiltonian path.

Question 2. What is the smallest number of disjoint spanning trees creates a graph T^{k} containing a shortest Hamiltonian path?

Questions 3 and 4. Replace in questions 1 and 2 a shortest spanning tree by a 1-tree. What is the smallest number of disjoint 1-trees creates a Hamiltonian graph? What is the smallest number of disjoint 1-trees creates a graph containing a shortest Hamiltonian cycle?

15233 | AMR-027-0903

10 Lectures and 42 Open Problems - Tightness of k-median LP

P / partially_solved | AMR 问题清单汇编

The **k-median** problem admits a natural **Linear Programming (LP)** relaxation (the facility-location-type LP with variables indicating whether a point is opened as a center / assigned to a center). Is the **k-median LP tight** - i.e., does its integrality gap equal 1 and its optimum recover an integral k-median solution - even for point clouds sampled from **generative models that do not have a community (cluster) structure**? (The motivation is the SBM-tightness style of analysis: for data coming from mixture models, e.g. over many well-separated clusters $\le k$, the LP/SDP is often tight w.h.p.; here the question is whether tightness extends to non-cluster generative models.)

15236 | AIM-PROBABILITY-0151

A complement correction and a pointed type-B f/h identity

S / solved | AIM 研讨会问题汇编

With the notation normalized but the words unchanged, it asks for elementary explanations of the following two claims.

1. Among centrally symmetric partial $((k+2)$-angulations of a regular $(2kn+2)$-gon having exactly i antipodal orbits of k-admissible chords, the proportion containing a diameter is i/n. 2. Among centrally symmetric k-divisible noncrossing partitions of a $2kn$-gon having exactly i antipodal orbits of nonzero blocks, the proportion containing a zero block is i/n.

It also confirms that the second assertion really says **contain a zero block** and really indexes by i orbits of **nonzero** blocks. The recovered remark says that the first and second claims concern, respectively, the f- and h-numbers of $\Delta^{(k)}_{B_n}$, and that no connection with $NC^{(k)}_{B_n}$ was then known.

Throughout, $n,k\geq 1$. Binomial coefficients outside their usual range are zero.

来源字段：https://aimath.org/WWN/braidgroups/braidgroups.pdf

15237 | AIM-PROBABILITY-0160

A conjugacy-class coalgebra and Hopf completion for Cayley intervals

P / partially_solved | AIM 研讨会问题汇编

The record is Problem 4.4, attributed to D. Armstrong, in the AIM workshop list *Braid groups, clusters and free probability*. Let G be generated by a finite set T that is closed under conjugation, let $\ell=\ell_T$, and order G by $$ u\le_T v\quad\Longleftrightarrow\quad \ell(v)=\ell(u)+\ell(u^{-1}v). $$ For $g\in G$, put $P_g=[1,g]$. The problem observes that these intervals are locally self-dual and that conjugate elements give isomorphic intervals. It asks for the structure of the map from conjugacy classes to the Ehrenborg function and, in particular, whether a Hopf structure is preserved.

There are three source-recovery issues.

1. The corpus starts with the duplicated OCR text `Problem 4.\n4.`; the PDF heading is **Problem 4.4**. 2. The displayed sum in the PDF/corpus has the bounds $1\le g_0\le\cdots\le g_k\le g$, while its monomial contains only the jumps $(g_{i-1}^{-1}g_i)$. Taken literally, this omits both boundary jumps and permits arbitrarily many zero jumps, so it is not the Ehrenborg series and does not have finite coefficients. Stanley's precise definition anchors both endpoints and requires the top to occur exactly once. The mathematically coherent recovered formula is therefore $$ F(P_g)=\sum_{k\ge1}\ \sum_{1=g_0\le g_1\le\cdots\le g_{k-1}<g_k=g} x_1^{\ell(g_0^{-1}g_1)}\cdots x_k^{\ell(g_{k-1}^{-1}g_k)}, \tag{1} $$ with $F(P_1)=1$. Equivalently, and without zero-part conventions, $$ F(P_g)=\sum_{1=h_0<h_1<\cdots<h_r=g} M_{(\ell(h_0^{-1}h_1),\ldots,\ell(h_{r-1}^{-1}h_r))}, \tag{2} $$ where $M_\alpha=\sum_{i_1<\cdots<i_r}x_{i_1}^{\alpha_1}\cdots x_{i_r}^{\alpha_r}$. Formula (1) is Stanley's equation (1), specialized to P_g; formula (2) is Ehrenborg's strict-chain definition. 3. Everything beginning with the heading `5. Free Probability` is spill from the next section and is not part of Problem 4.4. In particular, reference [47] belongs to that spill. Reference [49] is Stanley's paper cited below.

15238 | AIM-PROBABILITY-0063

A crease-balance law for a hat-shaped external field

P / partially_solved | AIM 研讨会问题汇编

`k_2\, \textrm{Re}\, z, & \textrm{Re}\, z0`

Its formula ends with the literal text

immediately followed by the source's closing dollar-sign delimiter,

and has neither a readable inequality in the second branch nor a closing `cases` environment. The linked AIM Problem Lists page returned a 502 error on 2026-08-11, so the missing source text could not be checked directly. The official workshop report does confirm that a group studied a “hat like external field.”

The natural reconstruction analyzed in this report is explicitly labeled as such:

\[\phi(x+iy)= \begin{cases} -k_1x,&x>0,\\ k_2x,&x<0, \end{cases} \qquad k_1,k_2>0, \tag{1} \]

with \(\phi(iy)=0\) by continuity. Thus \(\phi=-k_1x_+-k_2(-x)_+\), a ridge whose value decreases away from the imaginary axis. The missing condition may have been \(x<0\) or \(x\le0\); these give the same continuous field after defining the value on the axis.

The problem asks whether, for small \(\varepsilon_1,\varepsilon_2>0\), there is an \(S\)-curve joining

\[z_1=-\varepsilon_1+i, \qquad z_2=\varepsilon_2-i, \tag{2} \]

and asks about the corresponding max--min problem and whether its curve contains a portion of the imaginary axis.

A finite RBM separation from equal-parameter naive Bayes, with an SBN caveat

P / partially_solved | AIM 研讨会问题汇编

Recovered question. What kind of distributions can be represented by an RBM as opposed to directed models?

Its `problem` field is

The two sentences are identical.

The AIM workshop page does verify the September 2018 workshop and links to that open-problem list.

The phrase “directed models” is mathematically under-specified. A directed acyclic graphical model can have many architectures and conditional families. I analyze two particularly natural one-hidden-layer readings:

1. the binary naïve Bayes model, equivalently a mixture of product distributions; and 2. a one-hidden-layer sigmoid belief network (SBN) with independent binary hidden roots and conditionally independent visible children.

The answers differ. An RBM can require exponentially many naïve Bayes mixture components, but an explicit witness below is also represented by a same-size SBN. Thus “undirected versus directed” alone does not determine a representational comparison.

15247 | AIM-PROBABILITY-0054

A four-state sign-valued obstruction to fixed-tolerance function mixing bounds

S / solved | AIM 研讨会问题汇编

Let (X_i) be a stationary Markov chain on a finite state space Ω, let $f:\Omega\to[-1,1]$, and put $$ S_N=\frac1N\sum_{i=1}^N f(X_i). $$ Is there an absolute constant $c>0$ such that $$ \Pr\bigl(|S_N-\mathbb E S_N|\geq\varepsilon\bigr) \leq 2\exp\!\left(-\frac{cN\varepsilon^2}{t_f(\delta)}\right) \tag{1} $$ for every $\varepsilon>0$ and $N\geq1$? In particular, can one take the fixed tolerance $\delta=1/4$?

If the braces are read literally as asking for the supremum of all satisfactory times, an ergodic chain normally gives $+\infty$, making (1) vacuous.

The primary source of the terminology, Rabinovich--Ramdas--Jordan--Wainwright, defines instead $$ T_f(\delta):=\min\left\{t\in\{1,2,\ldots\}: \max_{x\in\Omega}\left|P^t f(x)-\pi f\right|\leq\delta\right\}. \tag{2} $$ Here $P^t f(x)=\mathbb E_x f(X_t)$ and $\pi f=\mathbb E_\pi f$. This is the definition used below. The counterexample also works for the stronger persistence version $$ T_f^{\rm pers}(\delta):=\min\left\{t\geq1: \sup_{m\geq t}\max_x|P^m f(x)-\pi f|\leq\delta\right\}, \tag{3} $$ so the conclusion does not depend on the possible distinction between one-time and thereafter mixing.

15248 | AIM-PROBABILITY-0108

A free-Jacobian covariance obstruction to drift-only changes of variables

P / partially_solved | AIM 研讨会问题汇编

The source PDF also drops a visible \(dt\) after each drift and prints a single \(k_t\) where a vector drift is apparently intended. The following separates the questions and records the minimal reconstruction used below.

1. **Process change of variables.** Given self-adjoint variables \(x_1,\ldots,x_m\) that arise at time one from a free stochastic equation \[dA_i(t)=dS_i(t)+k_{i,t}(A(s):s\leq t)\,dt, \qquad \mu_{A(1)}=\mu_x, \] and variables \(y_j=f_j(x_1,\ldots,x_m)\), is there an operation \(P\) on the drift such that \[dB_j(t)=dS_j(t)+P(k)_{j,t}(B(s):s\leq t)\,dt, \qquad \mu_{B(1)}=\mu_y? \] Here the inserted \(dt\) and component indices are reconstructions. For a noncommuting tuple, “functional calculus” is not automatic for arbitrary scalar functions, so the rigorous result below takes the \(f_j\) to be self-adjoint noncommutative polynomials. Analytic or sufficiently regular functional calculi would require a separately specified domain.

2. **Microstates free entropy.** Can the \(\limsup\) in the microstates definition of \(\chi\) be replaced by \(\liminf\)? Equivalently, do normalized logarithmic microstate volumes have enough asymptotic regularity that subsequences do not affect the resulting entropy?

3. **Free pressure.** For Hiai’s free pressure \(\pi_R(h)\) and its Legendre-transform entropy \(\eta_R(\tau)\), for which self-adjoint potentials \(h\in *_{i=1}^n C([-R,R])\) is the equilibrium tracial state, satisfying \[\eta_R(\tau)=\tau(h)+\pi_R(h), \] unique? The source suggests free transportation inequalities as one route.

15251 | AIM-PROBABILITY-0079

A Gaussian-mode audit for weakly nonlinear stochastic Hamilton-Jacobi equations

P / partially_solved | AIM 研讨会问题汇编

Stochastic Hamilton-Jacobi equations $\partial_th=F(\nabla h)+\Delta h+\xi_\epsilon$ with F scaled appropriately.

The exact AIM record is:

This is a sparse research prompt, not a mathematically complete assertion. In particular, the record itself does not specify:

- the spatial dimension or domain; - whether \(\xi_\varepsilon\) is spatially or space-time mollified; - the amplitude and argument scaling of \(F\); - the deterministic height counterterm and possible moving frame; - regularity, symmetry, or growth assumptions on \(F\); or - the topology and solution concept for a limit.

I reconstruct one precise version that is directly covered by the one-dimensional weak-universality literature. On \(\mathbb R\), let \(\xi\) be space-time white noise, choose an even smooth mollifier \(\rho\) with \(\int\rho=1\), set \[\rho_\varepsilon(x)=\varepsilon^{-1}\rho(x/\varepsilon), \qquad \xi_\varepsilon=\rho_\varepsilon*_{x}\xi, \] and consider \[\partial_t h_\varepsilon =\partial_x^2h_\varepsilon +\varepsilon^{-1}F\!\left(\sqrt\varepsilon\,\partial_xh_\varepsilon\right) +\xi_\varepsilon-C_\varepsilon. \tag{1.1} \] The intended limiting equation, when the effective quadratic coefficient is nonzero, is the Hopf-Cole-renormalized \(1+1\)-dimensional KPZ equation \[\partial_t h=\partial_x^2h+\lambda(\partial_xh)^2+\xi. \tag{1.2} \] The reconstruction (1.1) is a choice, not a claim that all other readings of the AIM sentence are equivalent. The torus, space-time-mollified noise, discrete smoothing, non-Gaussian noise, fixed-strength nonlinearity, and dimensions \(d\geq2\) require separate statements.

15252 | AIM-PROBABILITY-0082

A localization-and-stability route to KPZ fixed-point attraction

P / partially_solved | AIM 研讨会问题汇编

Prove that the fixed point is attractive (i.e., universal in some class of models).

This is problem 11.8 in the section “Big picture questions” from the AIM workshop *The Kardar-Parisi-Zhang equation and universality class*. The record is sparse: it does not name the fixed point, a scaling, a model class, an initial-data space, or a topology.

A model-dependent height function \(H\) should first be centered, tilted, and put under \(1{:}2{:}3\) scaling. Schematically, with nonuniversal constants suppressed,

\[h_N(t,x)=N^{-1/3}\bigl(H(Nt,vNt+N^{2/3}x)-cNt-\ell N^{2/3}x\bigr). \]

The constants and even the sign convention depend on the model. A precise attraction statement must specify them.

15256 | AIM-PROBABILITY-0037

A nonreversible stationary-valley reduction for noisy majority

P / partially_solved | AIM 研讨会问题汇编

Noisy majority model. The noisy majority model with parameter $\epsilon\in(0,1)$ is a spin system on a graph G that is the stationary distribution of the following Markov chain on $\Omega=\{\pm1\}^{V(G)}$: assign each vertex a rate-1 Poisson clock. When the clock at a site rings, the spin at that vertex randomizes according to a $\operatorname{Ber}(1/2)$ with probability ϵ and chooses the majority of the spins of its neighbors and itself with probability $1-\epsilon$ (flipping a coin in the event of a tie).

Consider the noisy majority model on $\mathbb Z_n^d$ for $d>1$. Show there exists a fixed $\epsilon>0$ such that $t_{\mathrm{mix}}\gtrsim\exp(n^\epsilon)$ (should be true for $\exp(cn)$).

15257 | AIM-PROBABILITY-0033

A one-dimensional counterexample and a bottleneck reduction for spin-glass mixing

P / partially_solved | AIM 研讨会问题汇编

\[H_n(\sigma)=\sum_{(i,j)\in E_n}J_{ij}\sigma_i\sigma_j, \qquad \mu_{n,J}(\sigma)=Z_{n,J}^{-1}e^{\beta H_n(\sigma)}, \]

where the couplings are described as a “random symmetric matrix with i.i.d. ±1 entries.” After fixing the disorder, it asks whether there are β_0 and $\varepsilon>0$ such that, for every $\beta\ge\beta_0$, Glauber dynamics has mixing time at least $\exp(n^\varepsilon)$.

The wording omits several quantifiers and conventions.

The exact repository record was therefore preserved, and all repairs above are labeled as reconstructions.

来源字段：http://aimpl.org/markovmixing/1/

15258 | AIM-PROBABILITY-0110

A one-sided diffuse cyclic amalgam criterion and an entropy-regularity obstruction

P / partially_solved | AIM 研讨会问题汇编

Inspection of pages 1-2 of the original PDF recovers the questions as follows.

1. **Diffuse amalgamation.** Given free group factors A,B with a common diffuse subalgebra $D\subset A,B$, what conditions on A,B,D guarantee that \[A *_D B \] is a free group factor?

2. **Weak rigidity and dimension.** For a regular weakly rigid (in the sense of Popa) subalgebra of a von Neumann algebra, is the free entropy dimension at most \(1\)?

3. **Betti number versus microstates dimension.** If $\gamma _1,\ldots,\gamma _n\in\Gamma$ generate a group whose first L^2-Betti number $\beta _1^{(2)}(\Gamma)$ is large, must the microstates free entropy dimension of the corresponding group generators be large? The notes say that the nonmicrostates version was known through work of Mineyev-Shlyakhtenko.

The symbols printed in the PDF are $A *_D B$ and $\beta _1^{(2)}(\Gamma)$. Thus this record really does contain three questions rather than one question with two numbered subparts.

For the third question this report uses $\delta _0$ for Voiculescu's modified microstates free entropy dimension. For group unitaries this means the dimension of the self-adjoint real-and-imaginary-parts tuple. The symbols $\delta ^*$ and $\delta ^\star$ denote the two nonmicrostates variants; they are not silently identified with $\delta _0$.

15263 | AIM-PROBABILITY-0022

A quantitative arcsine bound for permutation-walk occupation time

P / partially_solved | AIM 研讨会问题汇编

It is visibly truncated and is not a syntactically complete mathematical statement.

The lost AIM text was not recovered literally. The intended formulation can nevertheless be identified, up to the harmless choice between a permutation of size \(n\) with \(n-1\) increments and one of size \(n+1\) with \(n\) increments, from the primary paper that arose from this workshop. Fang et al. define a uniform permutation

\[\pi=(\pi_1,\ldots,\pi_{n+1})\in S_{n+1},\qquad X_k=\begin{cases} +1,&\pi_k<\pi_{k+1},\\ -1,&\pi_k>\pi_{k+1}, \end{cases} \]

and \(S_0=0,\ S_k=\sum_{i=1}^kX_i\). They define the strict-positive occupation count

\[\Gamma_n=\sum_{k=1}^n \mathbf 1\{S_k>0\}. \]

Their uniform-permutation corollary proves

\[\frac{\Gamma_n}{n}\ \Rightarrow\ Z, \qquad Z\sim\operatorname{Beta}(1/2,1/2), \]

and the paper then asks for error bounds. This verifies the reconstruction used here; it does not show that the missing AIM characters had exactly this typography.

An exact orthogonal-spike model for infinitesimal type-B cumulants

P / partially_solved | AIM 研讨会问题汇编

Problem 5.1 (F. Goodman, P. Sniady). Philippe Biane, Fred Goodman, and Alexandru Nica have defined a type B analogue of free probability [10]. The definition has been motivated by the combinatorics, and there is currently no model of this theory (as the large random matrices are a model for type A free probability). Find a natural model for type B free probability, which motivates the combinatorics. Is there a corresponding notion of free probability in other types?

Approximating and pointwise local-growth spaces can differ

S / solved | AIM 研讨会问题汇编

- the parameter \(r\) does not occur on the right-hand side of either displayed definition; - a scalar written as a limsup is followed by a further arrow to \(0\); - the second display uses \(\xi_n\), although no sequence is quantified there.

The primary source that grew out of this circle of questions, Haagerup--Schultz (2009), Definition 3.1(i), uses the coherent approximation condition \[\xi_n\longrightarrow\xi, \qquad \limsup_{n\to\infty}\|T^n\xi_n\|^{1/n}\le r. \tag{1} \] The natural comparison requested by the workshop question removes the exponent-dependent approximation and uses \(\xi\) itself. To prevent collision with later literature (where the approximating space is denoted \(E(T,r)\)), this report uses descriptive subscripts: \[\begin{split} \mathcal K_{\mathrm{app}}(T,r) &=\left\{\xi\in H:\exists\xi_n\to\xi, \ \limsup_{n\to\infty}\|T^n\xi_n\|^{1/n}\le r\right\},\\ \mathcal E_{\mathrm{pt}}(T,r) &=\left\{\xi\in H: \limsup_{n\to\infty}\|T^n\xi\|^{1/n}\le r\right\}. \tag{2} \end{split} \] Here \(T\in M\), where \(M\) is a \(\mathrm{II}_1\) factor acting on \(H\), and \(r\ge0\). The recovered question is whether the two spaces in (2) are always equal.

This reconstruction is explicit rather than silent. The literal printed formula has no well-defined pointwise second set and makes \(r\) irrelevant, so it cannot be the intended mathematical question.

Boundary corrections and nonexistence after SURE selection

S / solved | AIM 研讨会问题汇编

Let $X\sim MVN(\theta,I_d)$. Estimate θ by $X+h(X)$, with h in a class $\mathcal H$. For fixed h, \[\widehat r_h=d+2\nabla\cdot h(X)+\|h(X)\|^2 \] is unbiased for its quadratic risk. Let h^* minimize $\widehat r_h$ over $\mathcal H$, and let $\widehat\theta^*=X+h^*(X)$. Find an unbiased estimator r^{**} of the risk of $\widehat\theta^*$.

The exact mathematical request is:

The hidden issue is that h^* depends on the same X used to evaluate SURE. Write $\widehat h_x$ for the candidate selected when the observed value is x. The selected adjustment is the composite map

\[h_{\mathrm{sel}}(x)=\widehat h_x(x), \]

and the final estimator is

\[\delta^*(x)=x+h_{\mathrm{sel}}(x). \]

Even if each candidate is smooth, h_{sel} is usually only piecewise smooth and can jump when the SURE minimizer changes. The source does not specify $\mathcal H$, tie-breaking, differentiability, integrability, or whether generalized functions are permitted. These omissions are mathematically decisive.

Brown measure for unbounded affiliated operators

S / solved | AIM 研讨会问题汇编

For \(T\in\mathcal M^\Delta\), can one define a Brown measure \(\mu_T\) on \(\mathbb C\)?

This is Question 18 from the AIM workshop list *Free analysis*. In particular, it prints the defining integral as fragments such as

and uses the same symbol for a measure on the positive half-line and for the desired Brown measure on the complex plane.

Comparison with Definition 2.1 of Haagerup--Schultz, the work explicitly named by the question, fixes the notation. Let \(\mathcal M\) be a finite von Neumann algebra with faithful normal tracial state \(\tau\), let \(\widetilde{\mathcal M}\) be its closed densely defined affiliated operators, and let \(\mu_{|T|}\) be the spectral distribution of \(|T|\):

\[\mu_{|T|}(B)=\tau(E_{|T|}(B)),\qquad B\subseteq[0,\infty)\text{ Borel}. \]

The intended class and determinant are

\[\mathcal M^\Delta =\left\{T\in\widetilde{\mathcal M}: \int_0^\infty \log^+t\,d\mu_{|T|}(t)<\infty\right\}, \qquad \Delta(T)=\exp\!\left(\int_0^\infty\log t\,d\mu_{|T|}(t)\right). \]

Here \(\log^+t=\max(\log t,0)\). The integral in the determinant may equal \(-\infty\), so \(\Delta(T)\in[0,\infty)\); it cannot be \(+\infty\). The recovered question is:

Thus \(\mu_{|T|}\) in the hypothesis is a singular-value distribution on \([0,\infty)\), whereas \(\mu_T\) asked for is a Brown measure on \(\mathbb C\).

15337 | AIM-PROBABILITY-0106

Commuting multivariable Poisson smoothing and cyclic-gradient closure criteria

P / partially_solved | AIM 研讨会问题汇编

It contains two consecutive questions from the 2006 AIM workshop list *Free Analysis*. In the PDF, the first question ends at the bottom of page 1 (PDF index 0), and the second starts on page 2.

Inspection of the original PDF supports the following reconstruction.

Question A (multivariable Cauchy/Poisson smoothing). If \(A\) is an \(n\times n\) Hermitian random matrix and \(f:\mathbb R\to\mathbb R\), scalar Cauchy noise of scale \(\varepsilon\) gives \[\mathbb E_C f(A+C_\varepsilon)= (P_\varepsilon f)(A),\qquad (P_\varepsilon f)(x)=\int_{\mathbb R}f(y) \frac{\varepsilon}{\pi((y-x)^2+\varepsilon^2)}\,dy. \] Can this be done for several variables?

In the preceding PDF question the noise is said to be free from the original variable; the displayed question itself does not repeat that hypothesis. Thus “several variables” is genuinely underspecified: it could mean a commuting tuple with ordinary joint functional calculus, a tuple of noncommuting matrices with free functional calculus, or a matrix-valued analogue of a multivariate Cauchy law.

Question B (conjugate variables and cyclic gradients). Given self-adjoint \(X_1,\ldots,X_m\) in a tracial unital von Neumann algebra \((M,\tau)\), do their conjugate variables belong to the \(L^2\)-closure of the cyclic-gradient space? More precisely, with free difference quotients \[\partial_i X_j=\delta_{ij}1\otimes1, \qquad J_i=\partial_i^*(1\otimes1), \qquad D_i=m_{\rm flip}\circ\partial_i, \quad m_{\rm flip}(a\otimes b)=ba, \] do there exist \(H_k\in\mathbb C\langle\alpha_1,\ldots,\alpha_m\rangle\) such that \[(D_1H_k(X),\ldots,D_mH_k(X))\longrightarrow (J_1,\ldots,J_m) \quad\text{in }L^2(M)^m? \] We use the standard convention \(M=W^*(X_1,\ldots,X_m)\) and assume the free difference quotients and conjugates are well-defined. Without this convention, “densely defined on \(L^2(M)\)” and the location of the conjugate variables require extra ambient-algebra data not supplied by the question.

Counterexample to a malformed CCA limit and a corrected scalar Wasserstein bound

S / solved | AIM 研讨会问题汇编

For i.i.d. pairs (X_i,Y_i) with $X_i\in\mathbb R^p$ and $Y_i\in\mathbb R^q$:

1. find $a\in\mathbb R^p$ and $b\in\mathbb R^1$ maximizing $\operatorname{corr}(a^T X,b^T Y)$; 2. choose sample weights $\widehat a,\widehat b$ whose coordinates each sum to one and maximize the sample correlation $\widehat c$; 3. accept the asserted limit, under independence and finite fourth moments, \[A_n=-\left(n-\frac{p+q+3}{2}\right)\log(1-\widehat c) \ \Rightarrow\ \chi^2_{p+q-2}, \] and bound the distance to that chi-square law.

The record cites Hotelling (1936) and Bartlett (1939).

There are at least four distinct corruptions or conflations.

* Unless $q=1$, b must belong to $\mathbb R^q$, not $\mathbb R^1$. * Correlation is unchanged by nonzero rescaling. Standard population CCA imposes $a^T\Sigma_{XX}a=b^T\Sigma_{YY}b=1$, not coordinate-sum constraints. * Canonical correlations r_j are nonnegative singular values. Wilks' statistic uses $\prod_j(1-r_j^2)$, not $1-\widehat c$ for a largest signed correlation. * The complete-independence Wilks limit has pq degrees of freedom, not $p+q-2$.

Thus there is no finite-sample distance to the displayed target that can tend to zero. Section 7 gives a literal scalar counterexample and then analyzes a standard corrected reading.

15413 | AIM-PROBABILITY-0141

Domains for reflection-Catalan families and multiplicative convolution

P / partially_solved | AIM 研讨会问题汇编

“A pseudoreflection is a unitary operator ... whose eigenvalues are 0 with multiplicity \(n-1\), and \(-1\) with multiplicity 1.”

The problem asks for the largest natural domains of definition of \(NC_W\), \(NN_W\), and \(\Delta_W\), and of their applications. For an irreducible finite complex reflection group of rank \(n\), with invariant degrees \(d_1,\ldots,d_n\), it proposes \[\operatorname{Cat}(W):=\prod_{i=1}^{n}\frac{h+d_i}{d_i}, \qquad h=d_n, \tag{1.1} \] and warns that outside the duality/well-generated case the product may not be integral. It then asks about four directions:

- extending \(NC_W\) from finite Coxeter groups to well-generated complex reflection groups; - extending free probability beyond types \(A\) and \(B\), including Speicher's multiplicative functions; - understanding cluster algebras in infinite type; - extending \(NN_W\), the root order, and related objects from Weyl groups to noncrystallographic types, while identifying genuine barriers such as the absence of the usual Lie-algebra and affine-arrangement structures.

The missing continuations are verified as follows. The free-probability bullet ends “See Problem 5.1.” It is followed by “Explain the theory of cluster algebras in infinite types. See Problem 6.5.” The final bullet continues on page 5: it identifies nonnesting partitions as the most glaring crystallographic obstruction, cites Kriloff--Ram, and asks what Chapoton's \(H\)-triangle counts in noncrystallographic types. Problem 1.3 begins only after that bullet.

The PDF itself prints:

The standard corrected definition is that a complex pseudoreflection is a nonidentity finite-order linear map whose fixed subspace is a hyperplane. After choosing a unitary form, its eigenvalues are \[1\quad\text{with multiplicity }n-1, \qquad \zeta\ne1\quad\text{with multiplicity }1, \] where \(\zeta\) is a root of unity. Bessis uses exactly the fixed-hyperplane definition.

15414 | AIM-PROBABILITY-0038

Dyadic critical mixing solved and an exact general flip-graph reduction

P / partially_solved | AIM 研讨会问题汇编

The preserved input asks about equitable rectangular dissections of an \(n\times n\) lattice square into \(n\) rectangles of area \(n\), with \(n=2^k\), and the edge-flip Glauber chain having stationary weight \(\pi(\sigma)\propto\lambda^{|\sigma|}\). At \(\lambda=1\), it asks for a polynomial mixing-time upper bound in either of two state spaces:

1. dyadic tilings; or 2. all integral rectangular dissections.

The `literature` field is visibly corrupted: it twice contains `$\\lambda1$`, and calls \(O(n\log n)\) a lower bound. The following reconstruction is verified from Theorems 1.2--1.5 of Cannon--Miracle--Randall (CMR):

* for dyadic tilings, the chain is fast mixing in \(O(n^2\log n)\) for every fixed \(\lambda<1\), and has mixing time \(\exp(\Omega(n^2))\) for every fixed \(\lambda>1\); * for general rectangular dissections it is slow mixing both for \(\lambda>1\), with lower bound \(\exp(\Omega(n^2))\), and for \(\lambda<1\), with lower bound \(\exp(\Omega(n\log n))\); * the pre-2017 dyadic lower bound is \(\Omega(n\log n)\), not \(O(n\log n)\). Cannon--Levin--Stauffer (CLS), Theorem 1 and the paragraph preceding Theorem 2, explicitly identify it as an \(\Omega\)-bound coming from the flip-graph diameter.

There is also a normalization issue. CMR works on the \(n\times n\) lattice and, for each legal flip, assigns proposal probability \(1/(4n)\). CLS scales to the unit square, calls the number of rectangles \(n=2^k\), and chooses a rectangle and one of its four sides; each legal flip then has probability \(1/(2n)\). At \(\lambda=1\) the CMR transition matrix is exactly \[P_{\rm CMR}=\frac{I+P_{\rm CLS}}2. \tag{1} \] Thus the chains differ only by an additional factor-two lazification. All logarithms in the quoted CLS exponents are base two.

CMR assumes \(k\) even in the equitable lattice setup, so that the square ground state exists. The CLS dyadic theorem applies to every \(n=2^k\). Janson--Randall--Spencer use yet another convention: their “\(k\)-tiling” has \(2^k\) rectangles. We use \(n\) for the number of rectangles throughout.

Exact block-update heights for finite-range and speed-change exclusion

P / partially_solved | AIM 研讨会问题汇编

Height functions associated to exclusion processes with longer range jumps, or environment dependent speed-changes.

The exact AIM record is the one-line prompt:

It is Problem 11.6 in the AIM workshop list *The Kardar-Parisi-Zhang equation and universality class*. I interpret it as asking both how to define the microscopic height beyond nearest-neighbor ASEP and how far its hydrodynamic/KPZ fluctuation theory has been established.

“Environment dependent” is ambiguous. In the interacting-particle literature it may mean a translation-invariant rate depending on the nearby particle configuration (a speed-change process), or a rate depending on an external spatial environment. These are separated below. The exact height calculus applies to both, but their scaling theories are different.

Exact dropout decomposition for RBM likelihoods and an ordinary-RBM no-go example

P / partially_solved | AIM 研讨会问题汇编

Is using dropout during RBM training equivalent to adding a regularizing penalty term on to the training objective function?

The source record also compares the question with statements relating early stopping and an L_2 penalty. That comparison must be qualified: early stopping and ridge regression coincide or closely correspond only in particular models/parameterizations, not as an exact identity for arbitrary neural-network training.

There are three materially different readings of “dropout during RBM training”:

1. the expectation, over masks, of the exact conditional negative log-likelihood; 2. the negative log-likelihood of the visible marginal of the dropout mixture model; 3. the stochastic update field produced by the contrastive-divergence (CD) implementation.

They are not the same object. The rigorous result below answers the first reading, compares it with the second, and explains why it does not automatically answer the third.

15438 | AIM-PROBABILITY-0016

Exact graph heat flow on a product-RBM manifold

P / partially_solved | AIM 研讨会问题汇编

How can Wasserstein geometry on RBMs be used to approximate PDE solutions?

The official 2018 AIM workshop report does verify the surrounding context: a working group on Wasserstein distance and optimal transport studied Wasserstein natural gradients for Boltzmann machines [AIM18]. Accordingly, the **plausible but not source-verified reconstruction** used here is:

The reconstructed question is still underspecified: it does not name a PDE, state space, transport metric, RBM type, or approximation criterion. This report makes one rigorous choice suited to binary RBMs. The state space is the hypercube \(\mathcal X=\{0,1\}^n\); the PDE is the coordinate-flip graph heat equation (a finite-state master equation/discrete parabolic PDE); the metric is the logarithmic-mean dynamical transport metric of Maas [Maa11]; and the RBM ansatz is the product-Bernoulli visible family, represented either by a hidden-free RBM or by an RBM in which every hidden unit has degree at most one.

This choice is intentionally not called continuous \(W_2\) geometry. Binary RBM laws are supported on a finite set, and ordinary static \(W_2\) on that discrete ground space has no Riemannian infinitesimal tensor for nontrivial heat curves. A two-state obstruction is proved below.

Exact non-Gaussian SURE bias and transformed shrinkage criteria

P / partially_solved | AIM 研讨会问题汇编

It proposes two non-Gaussian integration-by-parts devices,

\[\mathbb E\{Yf(Y)\}=\mathbb E\{T(Y)f'(Y)\} \]

\[\mathbb E\{Yf(Y)\}=\sigma^2\mathbb E f'(Y^*), \]

and asks for the bias of Gaussian SURE for estimators of the form \(\widehat\theta=X+h(X)\), whether the bias divided by dimension tends to zero, and whether this can be applied to wavelet shrinkage.

1. After defining \(\overline Y=(Y_1,\ldots,Y_d)\), the displayed \(X=Y+\theta\) must mean \[X=\overline Y+\theta\in\mathbb R^d. \] 2. The displayed Gaussian formula \[\widehat r_h=d+2\nabla\!\cdot h(X)+\|h(X)\|^2 \] presumes \(\operatorname{Var}(Y)=1\). For variance \(\sigma^2\), its correctly scaled version is \[\widehat r_{h,\sigma} =d\sigma^2+2\sigma^2\nabla\!\cdot h(X)+\|h(X)\|^2. \] 3. The nested expectation in the definition of \(e_d\) is interpreted as the ordinary bias \[e_d=\mathbb E\widehat r_h- \mathbb E\|\widehat\theta-\theta\|^2. \] The capital \(\Theta\) in the prose is the same unknown vector \(\theta\).

All formulas below state their regularity and integrability assumptions explicitly.

Exact special cases and a defect reduction for the chi-star change-of-variables problem

P / partially_solved | AIM 研讨会问题汇编

Question. Does the change of variables formula for \(\chi\) also hold for \(\chi^*\)?

The nearby questions fix the intended context. The preceding item asks whether conjugate variables lie in the \(L^2\)-closure of cyclic gradients. The following item asks for a path-process change-of-variables rule for a causal free SDE. Thus the question concerns the multivariable microstates formula for an invertible noncommutative functional calculus, not merely the elementary scalar identity for one classical density.

In the standard analytic version, \(X=(X_1,\ldots,X_n)\) is a self-adjoint tuple, \(F=(F_1,\ldots,F_n)\) and \(G\) are mutually inverse tuples of convergent self-adjoint noncommutative power series, and \[\mathscr JF(X)=\bigl(\partial_jF_i(X)\bigr)_{i,j} \in M_n\bigl(M\bar\otimes M^{\mathrm{op}}\bigr) \] is the free Jacobian. Voiculescu's microstates formula is \[\chi(F(X)) =\chi(X)+ (\operatorname{Tr}_n\otimes\tau\otimes\tau^{\mathrm{op}}) \bigl(\log|\mathscr JF(X)|\bigr). \tag{1.1} \] Here \(\operatorname{Tr}_n\) is the **unnormalized** matrix trace. Equivalently, if the Fuglede--Kadison determinant is defined with the normalized trace \(\operatorname{tr}_n\), the last term is \[n\log\Delta_{\operatorname{tr}_n\otimes\tau\otimes\tau^{\mathrm{op}}} (\mathscr JF(X)). \] This normalization distinction is essential.

15469 | AIM-PROBABILITY-0059

External-source reduction and finite-N response bounds

P / partially_solved | AIM 研讨会问题汇编

The exact AIM record asks to study the Hermitian external-source ensemble

\[d\mathbb P_{N,A}(M)=\frac{1}{Z_N(A)} \exp\{-N\operatorname{Tr}(V(M)-AM)\}\,dM, \tag{1} \]

where \(N\) is even and

\[A=aJ,\qquad J=\operatorname{diag}(I_{N/2},-I_{N/2}), \tag{2} \]

so that the eigenvalues \(a\) and \(-a\) have equal multiplicity. It then mentions a source with distinct eigenvalues \(\alpha_1,\ldots,\alpha_j\), multiplicities \(n_1,\ldots,n_j\), and limits \(n_r/N\to c_r\).

The phrase “study” is broad. The official 2012 AIM workshop report makes the intended direction more precise: remove the assumption that \(V\) is even in the Riemann--Hilbert analysis and obtain universal local kernels in the bulk, at edges, and at critical points. This attempt does not silently replace that difficult local question by a global one. It records the current conditional global theory, gives the exact multiple-orthogonal-polynomial reduction, and proves finite-\(N\) identities and bounds which hold without reflection symmetry.

The source also omits a necessary hypothesis: a “general polynomial” does not always define a probability measure. Throughout, \(V\) is real and confining. For a nonconstant real polynomial this means precisely that its degree is even and its leading coefficient is positive.

15478 | AIM-PROBABILITY-0112

Filtered q-Hermite word recovery and resolved length cutoff

P / partially_solved | AIM 研讨会问题汇编

The question has four related parts.

Let \(H_{\mathbb R}\) be a real Hilbert space of dimension \(n\), let \(-1<q<1\), and let \[\Gamma_{q,n}=W^*\!\left(s_g(g)=l(g)+l(g)^*:g\in H_{\mathbb R}\right) \] act on the \(q\)-deformed Fock space.

1. Does the abstract von Neumann algebra \(\Gamma_{q,n}\) depend on \(q\)? 2. In the free case \(q=0\), recover intrinsically the tensor-word basis from the field algebra and seek a \(q\)-analogue with understandable combinatorics. 3. For generalized relations \[l(e_i)^*l(e_j)=\sum_{s,t}t_{i,j}^{s,t}\,l(e_s)l(e_t)^*+\delta_{ij}I, \tag{1.1} \] determine when the creation-operator \(C^*\)-algebra is an extension of a Cuntz algebra by the compact operators and when the associated fields generate a type \(\mathrm{II}_1\) factor. 4. If \(Q_{\le k}\) denotes the projection onto elements \(x\) for which \(x\Omega\) has Fock length at most \(k\), is \(\|Q_{\le k}\|_{\mathrm{cb}}\) polynomially bounded in \(k\)?

The following repairs are necessary.

- The source prints tensor vectors \[e_{i_1}^{\otimes\alpha_1}\otimes\cdots\otimes e_{i_r}^{\otimes\alpha_r}. \] The displayed condition \(i_1\ne\cdots\ne i_r\) must mean adjacent inequality \(i_a\ne i_{a+1}\), because these are the maximal constant runs of an arbitrary word. It cannot mean pairwise distinctness: the word \(1,2,1\) must be included. - Every run length is positive, \(\alpha_a\ge1\). The extraction “\(\alpha_1>0\)” is either a typesetting shorthand or a damaged subscript. - The recovered-algebra formula is \[T_{\alpha_1}(s_0(e_{i_1}))\cdots T_{\alpha_r}(s_0(e_{i_r}))\Omega, \] not the OCR strings \(s_0(e_1)\) and \(s_0(e_q)\). The source calls the polynomials “Chebytchev”; in the monic normalization they are \(U_m(x/2)\), the Chebyshev polynomials of the second kind, rather than the standard first-kind \(T_m\). - The coefficient in (1.1) is \(t_{i,j}^{s,t}\). An arbitrary array does not automatically define a positive Fock inner product, bounded creators, or a tracial vacuum state. Such hypotheses cannot be omitted. - The source projection is a cutoff \(Q_{\le k}\), not the homogeneous projection onto length exactly \(k\). This distinction changes a linear bound into an immediate quadratic bound after summation.

Finite-N boundary and routing-miss Stein comparisons for JSQ approximations

P / partially_solved | AIM 研讨会问题汇编

It asks about \(N\) unit-rate exponential servers, a Poisson arrival stream, and the occupancy vector

\[Q=(q_1,q_2,\ldots),\qquad q_i=\#\{\text{queues of length at least }i\}. \]

An arrival in the full join-the-shortest-queue (JSQ) system joins a globally shortest queue. The source asks for explicit Stein bounds between its stationary law and two approximations:

1. \(Q_2\): reject an arrival when all queues contain two jobs; 2. \(Q_3\): route an arrival to the shortest among \(k\) randomly chosen queues.

- “Arrive at a constant rate \(\lambda\)” is read as a Poisson process of **total** rate \(\lambda\), while service times are independent exponential random variables of rate one. Thus the load per server is \(\rho=\lambda/N<1\). Papers that write the total arrival rate as \(N\rho\) use the same model with different notation. - Starting from the empty state, the first modification is exactly the capacity-two JSQ chain: its closed state space has no queue longer than two, and an arrival is blocked precisely at \((q_1,q_2)=(N,N)\). This is the interpretation used below. - “\(k\) randomly chosen queues” does not say whether sampling is with or without replacement. Both versions are treated. Only sampling **without replacement** makes \(k=N\) exactly equal to JSQ at finite \(N\).

Interacting particle systems

Bulk of \(q\)-Whittaker \(2d\) dynamics. Invariant measure.

The AIM page was unavailable (HTTP 502 on 2026-08-12), and nearby records only confirm that this item belongs to the q-TASEP/q-Whittaker interacting-particle-system cluster of the workshop. The fragment omits the state space, update rule, boundary conditions, and meaning of “bulk.” There are at least three plausible readings:

1. **Triangular-array reading.** The continuous-time push-block dynamics on Gelfand--Tsetlin arrays from Macdonald-process theory. Its q-Whittaker measures are evolving fixed-time laws, not automatically invariant laws. 2. **Periodized bulk reading.** Transplant the same local rule away from the triangular boundary to interlacing particles on a two-dimensional torus and find a stationary measure. This is the reading most directly matched by Corwin--Toninelli (2016). 3. **Infinite-plane reading.** Construct a translation-invariant process and invariant Gibbs measure on an infinite interlacing array, or obtain these as a thermodynamic limit of tori.

The finite-torus reading was solved after the workshop. The infinite-plane reading is stronger and is not a formal corollary because a jump may push a vertically aligned string whose length grows with the volume. This report states the finite theorem precisely enough to identify the model and gives a rigorous finite-to-infinite reduction plus a height-gauge obstruction.

Gaussian-side decoupling and free-convolution density

P / partially_solved | AIM 研讨会问题汇编

Determine eigenvalue information, especially the limiting eigenvalue density of \(M_1\), in the Hermitian two-matrix model

\[Z_N^{-1}\exp\{-N\operatorname{Tr}[V(M_1)+W(M_2)+tM_1M_2]\}\,dM_1\,dM_2. \tag{1} \]

Its first case is \(V(x)=x^2/2\) and a general, not necessarily even, polynomial \(W\) of even degree. Its broader case takes \(V\) to be an even quartic and \(W\) to have no symmetry. This report uses the standard interpretation that \(M_1,M_2\) are \(N\times N\) Hermitian matrices and \(t\in\mathbb R\). “Even degree (no symmetry)” is understood as allowing odd lower-order terms, not as saying \(W(-x)=W(x)\).

There is an omitted normalization condition. A polynomial of even degree need not be confining: its leading coefficient must be positive. In the quadratic case the interaction imposes a sharper condition described below. Without it, (1) is not a probability density.

Infinite Cycles and Bose-Einstein Condensation

O / open | Oberwolfach 报告问题汇编

For the interacting spatial random-permutation model in dimension $d\geq3$, is the loss of probability mass into infinitely long cycles for an optimizer P of $\chi^{(\leq)}(\beta,\rho)$ equivalent to

$$\chi^{(\leq)}(\beta,\rho)\neq\chi^{(=)}(\beta,\rho)$$

and to the appearance of Bose-Einstein condensation? More specifically, for fixed β, is this loss absent for sufficiently small density ρ and present for sufficiently large ρ?

Initial-data universality requires the right coupling

P / partially_solved | AIM 研讨会问题汇编

It asks whether two possibly random, mutually independent initial height functions with the same hydrodynamic and fluctuation limits have the same later fluctuation limit, expected to be the KPZ fixed-point semigroup applied to the limiting initial fluctuations.

The record literally writes the hydrodynamic hypothesis as

\[\epsilon^{-1}h_i(\epsilon^{-1}x;0)\longrightarrow \bar h(x;0), \]

and its fluctuation hypothesis and desired conclusion as

\[\epsilon^{1/2}\left[h_i(\epsilon^{-1}x;0) -\epsilon^{-3/2}\bar h(\epsilon^{1/2}x;0)\right] \longrightarrow \widetilde h(x;0), \]

\[\epsilon^{1/2}\left[h_i(\epsilon^{-1}x;\epsilon^{-3/2}t) -\epsilon^{-3/2}\bar h(\epsilon^{1/2}x;t)\right] \longrightarrow \widetilde h(x;t). \]

The first display is almost certainly malformed as written. A microscopic exclusion height has order \(\epsilon^{-1}\) on Euler distance \(\epsilon^{-1}\), so the standard Euler rescaling multiplies it by \(\epsilon\), not \(\epsilon^{-1}\); Euler time is also normally rescaled. This possible typo is not silently repaired here.

The two fluctuation displays are nevertheless dimensionally consistent with KPZ \(1{:}2{:}3\) scaling. Put \(R=\epsilon^{-3/2}\). Then

\[R^{2/3}=\epsilon^{-1},\qquad R^{-1/3}=\epsilon^{1/2}, \qquad R^{-1/3}x=\epsilon^{1/2}x. \]

\[h_\epsilon(t,x)=\epsilon^{1/2} \left[h_{2\epsilon^{-3/2}t}(2\epsilon^{-1}x) +\epsilon^{-3/2}t\right]. \]

Lyashko-Looijenga fibers, noncrossing chains, and a dihedral shuffle model

P / partially_solved | AIM 研讨会问题汇编

The Lyashko--Looijenga mapping associates to any complex-valued function on a manifold the polynomial in one variable whose roots are the critical values of the function. The main theorem in [34] states that this mapping is a ramified covering for some families of functions. There is a known relationship between the Lyashko--Looijenga covering of the complex sphere, and the combinatorial cacti of Ian Goulden and David Jackson [27]. Interpret the combinatorics of the type A noncrossing partitions in terms of the Lyashko--Looijenga covering of the sphere. The degree of the covering is n^{n-2}, which is also the number of maximal chains in $NC_{A_{n-1}}$. This number is known to count many things, including labelled trees, and cacti. Do these combinatorics generalize to other types?

15697 | AIM-PROBABILITY-0164

Polytopality and an exact dihedral model for noncrystallographic associahedra

S / solved | AIM 研讨会问题汇编

Problem 6.1. When \(W\) is a noncrystallographic finite Coxeter group, give a geometric construction that realizes \(\Delta_W\) as a convex polytope. There is a realization of \(\Delta_W\) in all types as a complete simplicial fan, but it is not clear whether this fan is polytopal in the noncrystallographic types.

It is **Problem 6.1**, attributed to H. Thomas and A. Zelevinsky, in the AIM workshop list *Braid groups, clusters and free probability*.

The official PDF gives:

The preceding source paragraph defines \(\Delta_W\) as the flag complex of compatible subsets of the almost-positive roots \[\Phi_{\ge-1}=\Phi^+\cup(-\Pi). \] It also says that in types \(A,B\) these complexes generalize the **duals** of the classical associahedron and cyclohedron. Thus the precise reading is: construct a simple convex polytope whose polar boundary is \(\Delta_W\), and, more strongly, make the displayed complete fan its normal fan. Confusing the simplicial complex with the face lattice of the simple polytope rather than its dual reverses incidences.

The irreducible noncrystallographic finite types are \(I_2(m)\) other than \(m=3,4,6\), together with \(H_3,H_4\). Reducible cases follow from products/joins after treating irreducible factors.

Positive-temperature structure and a finite-rank gap criterion

P / partially_solved | AIM 研讨会问题汇编

What is the structure which replaces determinantal point processes and correlation functions and which allows for such computations?

The AIM record asks what replaces determinantal point processes and correlation functions for triangular arrays associated with positive-temperature polymers. These arrays arise as limits of Macdonald processes. Their fixed-level laws resemble GUE/LUE eigenvalue ensembles, but are not determinantal; nevertheless, Laplace transforms of an extremal coordinate can have Fredholm determinant formulas. The question asks for a structure making all analogous eigenvalues, especially joint gap probabilities, accessible.

Its concluding question is:

In modern terminology, geometric or birational RSK is the positive-temperature lift, while tropical RSK is the zero-temperature limit in which a scaled logarithm changes sums into maxima. The positive-temperature level laws are Whittaker measures or related Macdonald degenerations. This report preserves the source wording but calls the finite-temperature variables “Whittaker coordinates.”

15705 | AIM-PROBABILITY-0026

Power concavity and mode curvature of symmetric stable densities

P / partially_solved | AIM 研讨会问题汇编

For \(0<\alpha\le2\), let \(Y_\alpha\) have characteristic function \(e^{-|t|^\alpha}\) and density \(f_\alpha\). Prove that \(f_\alpha\) is \(s_\alpha\)-concave, in the standard non-strict sense, for some \(s_\alpha<0\), and prove \(f_\alpha''(0)<0\) at its mode.

Its problem field is preserved exactly:

Taken literally, the definition is impossible: at \(\lambda=0\), or whenever \(x=y\), its two sides are equal. The standard definition uses \(\ge\), as in Han and Wellner (2016). The displayed delimiters and parentheses on the live page are balanced; the missing item is the equality bar in the comparison sign, not a bracket.

Two further hypotheses must be restored.

1. The function \(t\mapsto e^{-|t|^\alpha}\) is a characteristic function precisely in the stable range \(0<\alpha\le2\). That is the range used below. 2. “Curvature at the mode is negative” is read as \(f''(m)<0\). At a stationary point this also says that the signed curvature of the graph is negative, and it is equivalent in sign to \((\log f)''(m)<0\).

The repaired problem is therefore:

q-Fuss-Catalan positivity and a Boolean q-Narayana refinement

S / solved | AIM 研讨会问题汇编

The record comes from Problem 2.1 of Drew Armstrong's outline of the January 2005 AIM workshop *Braid Groups, Clusters, and Free Probability*. I checked the original PDF, including the displayed signs and indices. It asks, for a finite Coxeter group W of rank n, Coxeter number h, exponents $e_1,\ldots,e_n$, and a positive integer k, to define

$$ \operatorname{Cat}^{(k)}_W(q) :=\prod_{i=1}^n\frac{[kh+e_i+1]_q}{[e_i+1]_q}, \qquad [a]_q=q+q^2+\cdots+q^a, \tag{1} $$

and prove that it is a polynomial in q with nonnegative integral coefficients. The source says this was then known in classical types A,B,D, and notes that in type A, $k=1$, it agrees up to a power of q with the Garsia--Haiman q,t-Catalan polynomial specialized at $t=1/q$.

The four follow-up questions in the source are:

1. replace e_i+1 by the fundamental degrees d_i for a complex reflection group, and replace h by the highest degree; 2. prove Reiner's cyclic-sieving evaluation at a primitive d-th root ζ, for $d\mid h$, counting elements of $NC_W=[1,c]$ fixed by conjugation by $c^{h/d}$; 3. determine positivity of $$ \operatorname{Cat}^{(k),+}_W(q) :=\prod_{i=1}^n\frac{[kh+e_i-1]_q}{[e_i+1]_q}, $$ and find a nonnegative q-refinement by Fuss--Narayana numbers; 4. construct q-Fuss versions of Chapoton's M-, F-, and H-triangles.

The plus sign in (1), the minus sign in the positive variant, and the conjugating exponent h/d are all verified from the PDF. The source's convention is nonstandard: if

$$ [a]_q^{\mathrm{std}}=1+q+\cdots+q^{a-1}, $$

then $[a]_q=q[a]_q^{\mathrm{std}}$. Every quotient in the problem has one such factor in numerator and denominator, so the rational functions are unchanged by switching conventions. At $q=0$, however, one must first cancel/simplify the rational expression and then evaluate the resulting polynomial; the raw source quotient has the form $0/0$.

Quadratic non-microstates pressure and weighted colored cycles

P / partially_solved | AIM 研讨会问题汇编

The terminal text `#0.3 "Free von Neumann Algebras", Dykema, Ricard` is the next section heading and is not part of the problem.

The page asks whether the Guionnet--Maurel-Segala planar-map interpretation of a microstates variational pressure has an analogue for non-microstates free entropy: $$ F(t)=\sup_{\tau\in TS(A)} \left\{\chi(\tau)-\tau\!\left(\sum_{a=1}^r t_aq_a\right)\right\}, \qquad F^*(t)=\sup_{\tau\in TS(A)} \left\{\chi^*(\tau)-\tau\!\left(\sum_{a=1}^r t_aq_a\right)\right\}. \tag{1.1} $$ Does F^* have a comparable interpretation by enumeration of colored planar maps?

Several symbols in the displayed map series are mangled in the AIM PDF itself. The primary Guionnet--Maurel-Segala paper fixes the intended convention. Relative to m independent GUE matrices, take $$ V_t=\sum_{a=1}^r t_a(q_a+q_a^*) $$ for monomials q_a. For small t, their normalized free energy is $$ F(t)-F(0)= \sum_{k\in\mathbb N^r\setminus\{0\}} \left(\prod_{a=1}^r\frac{(-t_a)^{k_a}}{k_a!}\right) \mathcal M((q_1,k_1),\ldots,(q_r,k_r)), \tag{1.2} $$ where $\mathcal M$ counts labeled connected colored planar maps with k_a stars of type q_a or q_a^*. If the q_a are already self-adjoint or the signs are absorbed into t_a, the shorter AIM display is consistent with (1.2).

There is also a normalization ambiguity. Guionnet--Maurel-Segala define the entropy in the relevant theorem relative to product GUE measure; the standard Lebesgue-normalized free entropy differs by the quadratic Gaussian energy and a constant. Consequently the map series is naturally a **pressure difference** with $F(0)=0$. A literal unnormalized standard χ would have a nonzero semicircular constant at $t=0$.

Finally, `TS(A)` cannot mean only the normal tracial states of a fixed II_1 factor: that would usually collapse the optimization to its unique normal trace. Operationally, and consistently with the primary paper, it means an admissible trace-state/noncommutative-law space for the distinguished generators, subject to a norm or moment cutoff. All results below are stated directly on the law space, avoiding this ambiguity.

Random biased transpositions: two-class cutoff, parity repair, and heterogeneous product reductions

P / partially_solved | AIM 研讨会问题汇编

Random biased transpositions. The random uniform transposition walk on S_n is the discrete time Markov chain that at each time step applies a transposition (i,j) uniformly at random.

The random nearly-uniform (biased) transposition walk is the corresponding chain that at each time step applies a transposition (i,j) with probability p_{ij} for p_{ij} comparable to the uniform rate up to uniformly bounded constants.

Does the random nearly-uniform transposition walk on S_n exhibit cutoff?

What about in the simpler case where $p_{ij}=p_i p_j$ for each $1\le i,j\le n$?

Randomstrasse101 Open Problems (2024) - Conjecture 5 (Ellipsoid fitting)

O / open | AMR 问题清单汇编

Let $n, d \geq 1$ and $x_1, \cdots, x_n \sim \mathcal{N}(0,\mathrm{I}_d/d)$. For any $\varepsilon > 0$: \begin{align}

\limsup_{d \to \infty} \frac{n}{d^2} \leq \frac{1-\varepsilon}{4} \Rightarrow \lim_{d \to \infty} \mathbb{P}[\exists \mathcal{E} \textrm{ an ellipsoid fit to } (x_i)_{i=1}^n] = 1, \\

\liminf_{d \to \infty} \frac{n}{d^2} \geq \frac{1+\varepsilon}{4} \Rightarrow \lim_{d \to \infty} \mathbb{P}[\exists \mathcal{E} \textrm{ an ellipsoid fit to } (x_i)_{i=1}^n] = 0. \end{align}

背景链接：https://arxiv.org/abs/2504.20539

15738 | AMR-144-0006

Randomstrasse101 Open Problems (2024) - Conjecture 8 (Kikuchi Spectral Threshold)

O / open | AMR 问题清单汇编

Given r,ℓ, n positive integers satisfying $n\gg \ell\geq \frac{r}2$ and r even (r and ℓ will be fixed and $n\to\infty$). For each $S\subset [n]$ with $|S|=r$ let $Z_S\sim\mathcal{N}(0,1)$, and all independent. Let $\lambda\geq 0$ and let M be the $\binom{n}{\ell} \times \binom{n}{\ell}$ matrix (with rows and columns indexed by subsets $I\subset[n]$ of size ℓ) given by \[M(\lambda)_{I,J} = \left\{ \begin{array}{ccl} \lambda + Z_{I \Delta J} & \text{if} & |I \Delta J| = r,\\ 0 &\text{otherwise,}& \end{array} \right. \] where $I\Delta J = (I\cup J) \setminus (I\cap J)$ denotes the symmetric difference.

Let $\lambda^\natural_{r,\ell}$ denote the threshold at which eigenvalues ``pop-out'' of the spectrum of $M(\lambda)$: in other words $\lambda^\natural_{r,\ell}$ is the real number such that, for all $\lambda>\lambda^\natural_{r,\ell}$, there exists $\varepsilon>0$ such that \(\mathbb{E}\lambda_{\max} M(\lambda)>(1+\varepsilon+o(1))\mathbb{E}\lambda_{\max} M(0),\) where $o(1)$ is a term that goes to zero as $n\to\infty$.

For fixed r, we have $$n^{\frac{r}4}\lambda^\natural_{r,\ell}\to 0$$ as $\ell\to\infty$ (note that this is after one has taken $n\to\infty$).

15740 | AMR-144-0008

Randomstrasse101 Open Problems (2024) - Problem 10 (How many deviations are needed afterall?)

O / open | AMR 问题清单汇编

It is easy to see that the statement of this conjecture implies Spencer's Theorem, since the columns of an $n\times n$, ±1 matrix, have ℓ_2 norm $\sqrt{n}$. The best current lower bound for K\'{o}mlos is a recent construction by Tim Kunisky [Tim-lowerboundKomlos] which shows a lower bound on K of $1+\sqrt{2}$. Unfortunately, the resulting matrix is not a ±1 matrix (even after scaling), and so it does not provide a lower bound for the Spencer setting.

What is the value of the following quantity? $$\sup_{n\in\mathbb{N}}\sup_{A\in\{\pm1\}^{n\times n}}\frac1{\sqrt{n}}\mathrm{disc}(A)$$

Randomstrasse101 Open Problems (2025) - Conjecture 1

O / open | AMR 问题清单汇编

An interesting question is to characterize the Lov\'asz number for random graphs. A well-known family of random graphs is the Erd\mathbb{H}{o}s-R\'enyi random graphs \(G(n, p)\). Here, \(n\) denotes the number of vertices, and \(0 \leq p \leq 1\) is the probability parameter. To sample a graph from \(G(n, p)\), for each pair of vertices \(i \neq j \in [n]\), one adds an edge independently with probability \(p\). The random graphs \(G(n, p)\) are ubiquitous in mathematics; for instance, they are used in combinatorics to lower bound *Ramsey* numbers. There are several results on the Lov\'asz number for Erd\mathbb{H}{o}s-R\'enyi random graphs \(G(n, p)\) (see [juhasz1982asymptotic,coja2005lovasz,aroranote]). However, the precise asymptotics of the Lov\'asz number for \(G(n, 1/2)\) is still open.

Let \(G\) be distributed as \(G(n, 1/2)\). Then, \begin{equation} \mathbb{E} \vartheta(G) = (1 + o(1))\sqrt{n}. \end{equation}

O / open | AMR 问题清单汇编

We start with the notion of localization [MMP-2019-LPCliques Paley,Kunisky-2023-SpectralPseudorandomnessPaleyClique] : Let $G_{p,1}$ denote the induced subgraph on the vertices adjacent to the node 0, which we call the 1-localization. Because the 1-localization does not depend on the node picked (see [Kunisky-2023-SpectralPseudorandomnessPaleyClique]) we have $\omega(G_p) \leq \omega(G_{p,1}) + 1 \leq \vartheta(\overline{G_p})+1$. It was observed empirically in [MMP-2019-LPCliquesPaley] that $\vartheta(\overline{G_{p,1}}) \sim \sqrt{p/2}$, which would recover the Hanson-Petridis bound (also, note that $G_{p,1}$ is a circulant graph and so the SDP corresponding to $\vartheta(\overline{G_{p,1}})$ reduces to an LP).

$\vartheta(\overline{G_{p,1}}) \sim \sqrt{p/2}$ (for $p \equiv 1 \pmod{4}$ prime) where $G_{p,1}$ is the 1-localization of the Paley Graph described above.

Randomstrasse101 Open Problems (2025) - Conjecture 2

O / open | AMR 问题清单汇编

\begin{definition} Given $A\in\mathbb{R}^{N\times M}$ let $\omega(A)$ be defined as \begin{equation} \omega(A) = \min_{S\subseteq [N]: \mathrm{rank}(A_{S^c})<n} \sigma_M(A_S), \end{equation} where A_S denotes the submatrix made of the rows indexed by S and σ_M is the M-th singular value (which is the smallest in non-degenerate situations). \end{definition} The complement property says that $\mathcal{A}$ is injective if and only if $\omega(A)>0$. [balan2013invertibility] shows that stability is tightly connected to the inverse of this quantity. They also make the following intriguing conjecture.

There exist universal constants $C>0$ and $0<\beta<1$ such that, for any $M>1$ and $A\in\mathbb{R}^{2M-1\times M}$ a matrix for which any subset of M rows spans $\mathbb{R}^M$, \[\omega(A) \leq C \max_{k\in[N]}\|A_k\|\beta^M, \] where A_k is the k-th row of A.

15753 | AMR-145-0009

Randomstrasse101 Open Problems (2025) - Conjecture 4

O / open | AMR 问题清单汇编

There is another approach to to use convex relaxation to potentially improve over upper bounds on the $\omega(G_p)$. Recall that the Lovasz ϑ function can be viewed a as degree-2 Sum-of-Squares relaxation of the clique (or independence) number. A fascinating question is whether the degree-4 Sum-of-Squares relaxation significantly improves on the $\sqrt{p}$ bound, perhaps even improving over the state of the art (see [KY-2022-PaleyDegree4SOS] for a precise construction of this relaxation). There have been several encouraging numerical experiments (for this and other SDPs) [KY-2022-PaleyDegree4SOS,kobzar2023revisiting,wang2024lower]. We particularly note that the numerical experiments in [KY-2022-PaleyDegree4SOS] suggest even a polynomial improvement may be possible, although the authors prove that it cannot improve beyond $\Omega(p^{\frac13})$.

There exists $\varepsilon>0$ such that the Sum-of-Squares relaxation of degree 4 for the clique number of the Paley graph gives a bound of $O(p^{\frac12-\varepsilon})$.

15754 | AMR-145-0010

Randomstrasse101 Open Problems (2025) - Conjecture 5

O / open | AMR 问题清单汇编

The Paley Equiangular Tight Frame construction satisfies the Restricted Isometry Property beyond the square-root bottleneck. In other words, there exists $\varepsilon>0$ such that, for $m \sim p^{1/2+\varepsilon}$, any matrix formed by picking m (distinct) vectors in the Paley ETF has condition number bounded by a constant independent of p.

Randomstrasse101 Open Problems (2025) - Problem 2

O / open | AMR 问题清单汇编

An interesting approach to this problem is to try to build Sum-of-Squares proofs of $\mathrm{MUB}(6)<7$. In [BDK-2022-DualBoundsMUB] it was shown that a certain relaxation related to degree-2 Sum-of-Squares cannot prove that $M(6) < 7$. It is however unclear whether higher degree levels of Sum-of-Squares can provide such a proof.

Is there a Sum-of-Squares degree 4 proof that there are no 7 Mutually Unbiased Bases in $\mathbb{C}^6$?

15813 | AIM-PROBABILITY-0025

Sharp total-variation asymptotics for Student t versus the standard normal

S / solved | AIM 研讨会问题汇编

It asks, for Student \(t_r\) with \(r\) degrees of freedom and \(Z\sim N(0,1)\):

1. Show that \(d_{\mathrm{TV}}(t_r,Z)\leq c/r\) for some \(c>0\). 2. Find the best such constant. 3. Decide whether \(d_{\mathrm{TV}}(t_r,Z)\geq c'/r\) for some \(c'>0\).

There is one mathematical convention to fix. Throughout this report,

\[d_{\mathrm{TV}}(P,Q) =\sup_A|P(A)-Q(A)| =\frac12\int_{\mathbb R}|p-q|\,dx. \]

There is also a quantifier ambiguity. Because the prompt begins “as \(r\to\infty\),” “best constant” naturally means the sharp constant for all sufficiently large \(r\), equivalently the sharp first-order asymptotic coefficient. If instead the inequality is required for every positive integer \(r\), the three low degrees must be included separately. Both readings are handled below.

Signed-cycle traces and the full B2 diagonal coinvariant module

P / partially_solved | AIM 研讨会问题汇编

Problem 2.2 (C. Kriloff and V. Reiner), recovered. This is a possible systematic approach to Problem 2.1. As mentioned, in type \(A\) with \(k=1\), the numbers (1) correspond (up to a power of \(q\), and specialized at \(t=1/q\)) with the \(q,t\)-Catalan numbers of Garsia and Haiman, which are given by the \(q,t\)-bigraded Hilbert series for the sign-isotypic component of the ring of diagonal harmonics \[\mathbb C[V\oplus V^*]/\langle \mathbb C[V\oplus V^*]^W_+\rangle. \] Can this situation be generalized to other \(W\)? When \(W\) is a symmetric group \(A_{n-1}\), it is known that the action of \(W\) on the (ungraded) diagonal harmonics has the same irreducible decomposition as the action of \(W\) on the “finite torus” \(Q/(h+1)Q\), where \(Q\) is the root lattice. Mark Haiman noted this does not hold in type \(B\). However, Iain Gordon has shown that it is possible to take a further quotient which does give the desired combinatorics.

15838 | AIM-PROBABILITY-0049

Solved cutoff and an exact rank-correlation observable

S / solved | AIM 研讨会问题汇编

Cutoff for random-to-random shuffle. The random-to-random card shuffle on \(S_n\) has cutoff at \(\frac{3n}{4}\log n\).

The intended chain is the **random-to-random insertion shuffle**. From a deck of \(n\) distinct labeled cards, choose a card uniformly, remove it, choose independently a final position uniformly from \(\{1,\ldots,n\}\), and insert the card there. One step therefore has \(n^2\) equally likely ordered choices. The chain is discrete-time and needs no added laziness: the probability of leaving the deck unchanged is \(1/n\). It is symmetric, irreducible, aperiodic, and has uniform stationary distribution on \(S_n\).

Throughout, \(\log\) is the natural logarithm. For transition kernel \(P_n\), uniform law \(U_n\), and total variation distance, \[d_n(t)=\max_{\sigma\in S_n}\|P_n^t(\sigma,\cdot)-U_n\|_{\rm TV}. \] Translation invariance makes the maximum independent of the starting permutation. A center \(t_n\) and window \(w_n=o(t_n)\) describe cutoff if \[\lim_{c\to\infty}\limsup_{n\to\infty}d_n(t_n+cw_n)=0, \qquad \lim_{c\to\infty}\liminf_{n\to\infty}d_n(t_n-cw_n)=1. \]

The later \(1.5324n\log n\) upper bound is joint work of **Chuan Qin and Ben Morris**, not Morris alone, and its coefficient is \(1.5324\), not exactly \(3/2\).

15880 | AIM-PROBABILITY-0122

Taylor coefficients and complex HCIZ free energy

P / partially_solved | AIM 研讨会问题汇编

There is another result that states that \(\frac{\partial^n}{\partial t^n}\log IZ(tA_n,B_n)|_{t=0}\) converges. Does this expression match \(\psi\) above? Can we extend Guionnet and Zeitouni's result to complex parameters?

This is Question 20 in the 2006 AIM workshop list *Free analysis*, immediately after the definition of an Itzykson--Zuber integral and a summary of the Guionnet--Zeitouni theorem. The supplied record says

Inspection of the original PDF confirms that the displayed derivative is typeset with order \(n\), the same letter used for matrix dimension. Taken literally, it asks about a derivative whose order grows with dimension. That is not the theorem in the relevant primary source.

The “another result” is Benoît Collins's theorem. Collins uses dimension \(d\), holds the derivative order fixed, and proves convergence of

\[\left.\frac{\partial^q}{\partial z^q}
\left[d^{-2}\log\int_{U(d)}
e^{zd\operatorname{Tr}(X_dUY_dU^*)}\,dU\right]
\right|_{z=0} \qquad(q\text{ fixed as }d\to\infty). \]

Thus two repairs are required before comparing with the Guionnet--Zeitouni free energy:

1. use a fixed derivative order \(q\), not the diagonal regime \(q=n\); 2. normalize the logarithm by the natural free-energy scale \(n^{-2}\).

The AIM PDF's preceding line also records an asymptotic of the form \(IZ\sim\exp(-n\psi)\), while the standard full-rank HCIZ integral with exponent \(n\operatorname{Tr}\) has logarithm of order \(n^2\). The primary Guionnet--Zeitouni and Collins papers both use the \(n^{-2}\log IZ\) normalization. Accordingly, this report does not silently identify the printed \(\psi\); it defines the normalization explicitly and then states the sign relation.

Let \(A_N,B_N\) be deterministic Hermitian \(N\times N\) matrices and let Haar measure on \(U(N)\) be normalized. Set

\[I_N(z)=\int_{U(N)}
\exp\!\left\{zN\operatorname{Tr}(A_NUB_NU^*)\right\}\,dU,
\qquad F_N(z)=\frac1{N^2}\Log I_N(z), \]

where near zero \(\Log\) denotes the branch with \(F_N(0)=0\). The source's negative-exponent convention is

\[IZ_N(tA_N,B_N)=I_N(-t). \]

\[IZ_N(tA_N,B_N)=\exp\{-N^2\psi(t)+o(N^2)\}, \]

then, wherever the limiting free energy \(F\) is defined,

\[\psi(t)=-F(-t). \tag{1.1} \]

If the source intended normalized trace instead of ordinary \(\operatorname{Tr}\), the exponent must be rescaled equivalently; the invariant point is that the log partition function is divided by its \(N^2\) full-rank scale.

15890 | AIM-PROBABILITY-0055

Time-convention audit and an exact bottleneck for monotone censored cube walks

P / partially_solved | AIM 研讨会问题汇编

Let \(A\subset\{0,1\}^n\) be monotone increasing. The random walk chooses a coordinate uniformly, flips it, and accepts the move only if the new point remains in \(A\). Can one prove an \(O(n\log n)\) upper bound on its mixing time?

Two omitted conventions materially change the answer.

First, the stated always-flip walk is not the chain in Ding and Mossel's primary 2014 paper. Their chain chooses a coordinate and **rerandomizes** its bit to a fair bit, rejecting only if the proposed configuration is outside \(A\). Equivalently, it is the \(1/2\)-lazy version of the censored flip walk: if a proposed flip is valid, move with probability \(1/2\), and otherwise stay. This is also the convention used explicitly by Fei and Ferreira Pinto Jr. in 2025. It repairs periodicity.

Second, a density-free \(O(n\log n)\) assertion is already false for the lazy chain. The open question in Ding--Mossel assumes \[\mu(A):=\frac{|A|}{2^n}\geq \alpha>0 \tag{1} \] and asks for \(t_{\rm mix}=O_\alpha(n\log n)\).

1. the literal always-flip chain; 2. the lazy chain for arbitrary nonempty monotone \(A\); 3. the intended lazy, constant-density conjecture (1).

15900 | AIM-PROBABILITY-0114

Transported compact resolvent and a Tauberian entropy-dimension reduction

P / partially_solved | AIM 研讨会问题汇编

The original PDF and its raw page-content stream were inspected.

The source asks about a limiting random-matrix/free-Gibbs law whose formal density is \[\exp\{-N\operatorname{Tr}p(A_1,A_1^*,\ldots,A_m,A_m^*)\}, \] and whose conjugate variables satisfy \(J_i=\mathcal D_iP\). Writing \(\partial_j\) for Voiculescu's free difference quotient at the limiting variables, it asks whether \[\exp\!\left(-t\sum_j\partial_j^*\partial_j\right) \tag{1.1} \] is compact in the \(N\to\infty\) limit. It proposes as a starting point \[P=\sum_i A_i^2+\sum_i t_iq_i(A_1,\ldots,A_m), \tag{1.2} \] in the small-perturbation regime studied by Guionnet--Maurel-Segala.

Compactness in (1.1) can only mean compactness as an operator on the limiting Hilbert space \(L^2(M,\tau)\). Compactness is not an intrinsic Banach-space property of a map “on the algebra” unless a topology and norm are specified. The notation \(A_i,A_i^*\) allows genuinely nonnormal models, whereas (1.2) is the self-adjoint starting case. The proved results below treat a finite self-adjoint tuple; the nonnormal case is listed as a gap.

The next source item begins after the heading `0.4 Focus Group on Free Entropy (day 3)`. A font-level audit resolves the damaged title unambiguously: \[\boxed{\text{Is }\delta^*=\delta^\star\text{?}} \tag{1.3} \] The first superscript is the Computer Modern symbol-font asterisk and the second is character `0x3f` in Computer Modern math italic, namely \(\star\). It is not a question-mark superscript.

The PDF as printed then displays \[\delta^*=n-\limsup_{t\downarrow0} \frac{\chi^*(x_1+\sqrt t\,s_1,\ldots,x_n+\sqrt t\,s_m)} {\log t^{1/2}}, \tag{1.4} \] and \[\delta^\star=n-\limsup_{t\to0}\sum_{i=1}^n t\Phi^*(x_1+\sqrt t\,s_1,\ldots,x_m+\sqrt t\,s_m). It also prints `lim sup` in both displays.

The standard definitions in Voiculescu's theory, for an \(n\)-tuple \(X=(x_1,\ldots,x_n)\) and a variance-one semicircular tuple \(S=(s_1,\ldots,s_n)\) free from \(X\), are \[\delta^*(X) =n-\liminf_{t\downarrow0} \frac{\chi^*(X+\sqrt t\,S)}{\log\sqrt t}, \tag{1.6} \] and \[\delta^\star(X) =n-\liminf_{t\downarrow0}t\Phi^*(X+\sqrt t\,S). \tag{1.7} \] Equations (1.6)--(1.7), not the malformed displays (1.4)--(1.5), are used below.

15907 | AIM-PROBABILITY-0069

Two-time KPZ laws: fixed-point formulas and a finite-time full-profile obstruction

P / partially_solved | AIM 研讨会问题汇编

Compute multi-time distribution for KPZ. What is the distribution $F'_{t_1,t_2}(\xi_1,\xi_2)$ such that $$ \mathbb P\bigl(A_{t_1}(x)\leq \xi_1, A_{t_2}(x)\leq \xi_2\bigr) =F'_{t_1,t_2}(\xi_1,\xi_2)? $$

The record does not restate the initial condition or define A_t. The immediately preceding canonical record, AIM-PROBABILITY-0068, gives the narrow-wedge convention $$ \mathcal Z(0,\cdot)=\delta_0, \qquad \mathcal Z(t,X)= \exp\left\{-\frac{X^2}{2t} +t^{1/3}A_t(t^{-2/3}X)-\frac{t}{24}\right\}. \tag{1.1} $$ I therefore treat narrow-wedge initial data as the intended reading. With $u=t^{-2/3}X$, (1.1) says exactly $$ A_t(u)=t^{-1/3}\log \mathcal Z(t,t^{2/3}u) +\frac{u^2}{2}+\frac{t^{2/3}}{24}. \tag{1.2} $$ There is a small ambiguity in the source: keeping the same argument x in $A_{t_1}(x)$ and $A_{t_2}(x)$ compares the physical locations $X_i=t_i^{2/3}x$, not one fixed physical location. The latter question would instead use $A_{t_i}(t_i^{-2/3}X)$. Both conventions are recorded below.

The two heights must be constructed from the **same space-time white noise**. Using two independent KPZ solutions would change the question and make the joint CDF the product of its marginals.

15908 | AIM-PROBABILITY-0152

Type-B extreme diameters and a dihedral meander determinant

P / partially_solved | AIM 研讨会问题汇编

Problem 2.4 (H. T. Hall). Suppose that a stream has \(2n\) bridges across it. A classical meander is (the homotopy class of) a closed path which crosses each bridge once without intersecting itself. On each side of the stream, the meander is given by a noncrossing pairing of the set \[[2n]:=\{1,2,\ldots,2n\}. \] Noncrossing pairings are naturally in bijection with type \(A\) noncrossing partitions of the set \([n]\).

Every ordered pair of noncrossing partitions defines a path (with possibly multiple components) which crosses each bridge exactly once. There is a bijection which says that the meanders (the paths with only one connected component) correspond exactly to pairs of noncrossing partitions that are maximally separated in the Hasse diagram of \(NC_{A_{n-1}}\) (they are diameters in the graph-theoretical sense). Does this bijection suggest a new way to count meanders?

One may also use this bijection to define meanders of type \(W\) (they are the ordered diameters of the Hasse diagram of \(NC_W\)). Is there some combinatorial object that this corresponds to? Is there a type \(B\) meander?

Remark (A. Nica and J. Scott). In type \(A\), one may build a “meander determinant” which is known to factor as a product of Chebyshev polynomials. Similarly, one may define a type-\(W\) meander determinant. What factorization properties does it have? Meanders are related to chromatic polynomials of graphs and the Temperley--Lieb algebra. What is the significance of type-\(W\) meanders in this context?

Uniform finite results and a dihedral infinite-type boundary

P / partially_solved | AIM 研讨会问题汇编

Reading)** under “3. Reflection Groups.” In modern notation the problem fixes a finite Coxeter system \((W,S)\) and a Coxeter element \(c\), and asks:

1. Give a uniform proof that the \(c\)-sortable elements are counted by \[\operatorname{Cat}(W)=\prod_{i=1}^{r}\frac{h+d_i}{d_i}. \] 2. Give a uniform proof that the map \(\operatorname{nc}_c\) to \(NC(W,c)=[e,c]_T\) is well-defined. 3. Give uniform proofs that \(\operatorname{nc}_c\) and the map \(\operatorname{cl}_c\) to \(c\)-clusters are bijections. 4. The definitions extend to infinite Coxeter groups. What happens there?

The printed PDF writes the maps as “nc” and “cl”; their dependence on the chosen Coxeter element is explicit in the preceding sentence. Reading's standard notation, used here, is \(\operatorname{nc}_c\) and \(\operatorname{cl}_c\). The PDF's item (1) says “Coxeter-sorted elements” once, while the surrounding definition and the cited paper say **Coxeter-sortable**; “sorted” is a source typo, not a second concept. The damaged “\(c.\)There” and “\(NCW\)” are repaired to \(c\), sentence spacing, and \(NC_W\), respectively.

15946 | AIM-PROBABILITY-0083

Weight universality for LPP and polymers: a finite-volume sensitivity reduction

P / partially_solved | AIM 研讨会问题汇编

For example, prove universality of LPP and polymer (with respect to weight distributions).

This is item 11.85 in the “Big picture questions” section of the AIM workshop *The Kardar-Parisi-Zhang equation and universality class*.

The recovered target must specify at least five choices:

1. **Geometry:** here the primary target is point-to-point up-right paths across rectangles $([1,m]\times[1,n]$, with $m/n\to\gamma\in(0,\infty)$ (full aspect ratio, or curved/droplet geometry). 2. **Temperature:** last-passage percolation (LPP) is zero temperature; a directed polymer at inverse temperature $\beta\in(0,\infty)$ is positive temperature. 3. **Weight class:** a plausible strong-universality class consists of nondegenerate i.i.d. light-tailed weights, with additional regularity when uniqueness or curvature is needed. Heavy-tailed and degenerate laws are not silently included. 4. **Centering and scaling:** the law of the weights changes the limit shape/free-energy density and the scale constant. Only the normalized fluctuations are predicted to be universal. 5. **Universality tier:** equality of exponents, a one-point Tracy-Widom limit, convergence of a spatial profile to an Airy process/KPZ fixed point, and convergence of the full random directed metric and geodesics to the directed landscape are successively stronger statements.

For LPP with i.i.d. law ν, the full-aspect-ratio one-point conjecture has the form

$$ \frac{L_{\lfloor\gamma n\rfloor,n}-n g_\nu(\gamma)} {c_\nu(\gamma)n^{1/3}}\ \Longrightarrow\ \mathrm{TW}_{\mathrm{GUE}}, $$

for a curved characteristic direction and nonuniversal constants g_ν,c_ν. For a fixed-temperature polymer, writing

$$ F_{m,n}^{(\beta)}=\frac1\beta\log Z_{m,n}^{(\beta)}, $$

the analogous conjecture replaces g_ν,c_ν by $f_{\beta,\nu},c_{\beta,\nu}$. Process-level attraction requires simultaneous centering in a $n^{2/3}$ spatial window and convergence under the KPZ $1{:}2{:}3$ scaling, not merely a one-point limit.

Green's potential

Existence theory for \(S\)-curves in a general sense, if the logarithmic potential is replaced by Green's potential.

Nearby AIM records concern scalar \(S\)-curves and max--min problems. The most faithful precise formulation is therefore: for a planar Greenian domain \(D\), external field \(\phi\), and Hausdorff-topologized class \(\mathcal F\) of admissible compact continua, first minimize weighted Green energy over probability measures on each \(F\), then maximize the equilibrium energy over \(F\), and ask whether a maximizer exists and has the Green \(S\)-property. This report distinguishes that free-boundary problem from the classical fixed-compact problem.

Assume the Continuum Hypothesis{}. Settings (c),(h), and (i) were realized in [coc2], Setting (k) was realized in [o-bdd], and Setting (n) was realized in [Rec94, Brendle96, MilNonGamma]. To realize Setting (b), take a set L as in Setting (c) and a set S as in Setting (i), and take $X=L\cup S$. As $\mathsf{S}_{\mathrm{fin}}(\mathrm{B},\mathrm{B})$ is additive, X satisfies this property. But since $\mathsf{S}_1(\mathrm{B}_\Gamma,\mathrm{B}_\Omega)$ and $\mathsf{S}_1(\mathrm{B},\mathrm{B})$ are hereditary for subsets [ideals], X does not satisfy any of these. It seems that using forcing-theoretic arguments similar to those of [Brendle96], we can realize Settings (f) and (m).

Does the Continuum Hypothesis{} imply a realization of the settings (d),(e),(g),(j), and (l)?

16120 | AMR-134-0025

Selection Principles Milestone Problems - Problem 26 ([GN, p. 160])

O / open | AMR 问题清单汇编

The following problem is classical by now, but it is related to the problems which follow. For a sequence $\{X_n\}_{n\in\mathbb{N}}$ of subsets of X, define $\liminf X_n = \bigcup_m\bigcap_{n\ge m} X_n$. For a family $\mathcal{F}$ of subsets of X, $L(\mathcal{F})$ denotes its closure under the operation $\liminf$. The following definition appears in the celebrated paper [GN] just after that of the γ-property: X is a *δ-set* (or: has the *δ-property*) if for each ω-cover $\mathcal{U}$ of X, $X\in L(\mathcal{U})$. Observe that if $\{U_n\}_{n\in\mathbb{N}}$ is a γ-cover of X, then $X=\liminf U_n$. Thus, the γ-property implies the δ-property. Surprisingly, the converse is still open.

Is the δ-property equivalent to the γ-property?

背景链接：https://arxiv.org/abs/math/0312182

16121 | AMR-134-0026

Selection Principles Milestone Problems - Problem 27 ([GJ, Question 2.4])

O / open | AMR 问题清单汇编

For an ultrafilter p, $\mathcal{O}_p$ denotes the collection of open γ_p-covers of X, that is, open covers $\mathcal{U}$ that can be enumerated as $\{U_n\}_{n\in\mathbb{N}}$ where $\{n : x\in U_n\}\in p$ for all $x\in X$. The property $\binom{\Omega}{\mathcal{O}_p}$ is called *the γ_p-property* in [GTpseq].

Is the property $\binom{\Omega}{\mathcal{O}_p}$ additive for each ultrafilter p?

Selection Principles Milestone Problems - Problem 4 ([pawlikowskireclaw], [CBC, Problem 45], [ideals])

O / open | AMR 问题清单汇编

Borel's Conjecture, which was proved to be consistent by Laver, implies that each set of reals satisfying $\mathsf{S}_1(\mathcal{O},\mathcal{O})$ (and the classes below it) is countable. From our point of view this means that there do not exist ZFC examples of sets satisfying $\mathsf{S}_1(\mathcal{O},\mathcal{O})$. A set of reals X is a *σ-set* if each G_δ set in X is also an F_σ set in X. In [CBC] it is proved that every element of $\mathsf{S}_1(\mathcal{B}_\Gamma,\mathcal{B}_\Gamma)$ is a σ-set. According to a result of Miller [Mil79Len], it is consistent that every σ-set of real numbers is countable. Thus, there do not exist uncountable ZFC examples satisfying $\mathsf{S}_1(\mathcal{B}_\Gamma,\mathcal{B}_\Gamma)$. The situation for the other classes, though addressed by top experts, remains open. In particular, we have the following.

Does there exist (in ZFC) an uncountable set of reals satisfying $\mathsf{S}_1(\mathcal{B}_\Gamma,\mathcal{B})$?

O / open | AMR 问题清单汇编

The *monotonic sequence selection property* is defined like the SSP with the additional assumption that for each n the sequence $\{f^n_k\}_{k\in\mathbb{N}}$ converges pointwise *monotonically* to $\mathbf{0}$.

Does the monotonic sequence selection property of $C_p(X)$ imply the weak sequence selection property?

背景链接：https://arxiv.org/abs/math/0312182

16137 | AMR-134-0042

Selection Principles Milestone Problems - Problem 43 ([SakaiRez, Question 3.5], [reznicb])

O / open | AMR 问题清单汇编

In [coc7] it is shown that $C_p(X)$ has countable fan tightness as well as Reznichenko's property if, and only if, each finite power of X has the Hurewicz covering property. Recently, Sakai found an exact dual of the Reznichenko property: An open ω-cover $\mathcal{U}$ of X is *ω-shrinkable* if for each $U \in \mathcal{U}$ there exists a closed subset $C_U\subseteq U$ such that $\{C_U : U \in \mathcal{U}\}$ is an ω-cover of X. Then $C_p(X)$ has the Reznichenko property if, and only if, each ω-shrinkable open ω-cover of X is ω-groupable [SakaiRez]. Thus if X satisfies $\binom{\Omega}{\Omega^{gp}}$, then $C_p(X)$ has the Reznichenko property. The other direction is not clear.

Is it true that $C_p(X)$ has the Reznichenko property if, and only if, X satisfies $\binom{\Omega}{\Omega^{\mbox{*\tiny gp*}}}$?

Does $C_p(\mathbb{N})$ have the Reznicenko property?

背景链接：https://arxiv.org/abs/math/0312182

16139 | AMR-134-0044

Selection Principles Milestone Problems - Problem 45 ([SakaiRez, Question 2.8])

O / open | AMR 问题清单汇编

A family $\mathcal{P}$ of subsets of of a space Y is a *π-network* at $y\in Y$ if every neighborhood of y contains some element of $\mathcal{P}$. Y is a *Pytkeev space* if for each $y\in Y$ and $A\subseteq Y$ such that $y\in\overline{A}\setminus A$, there exists a countable π-network at y which consists of infinite subsets of A. In [SakaiRez] it is proved that $C_p(X)$ is a Pytkeev space if, and only if, for each ω-shrinkable open ω-cover $\mathcal{U}$ of X there exist subfamilies $\mathcal{U}_n\subseteq\mathcal{U}$, $n\in\mathbb{N}$, such that $\bigcap_{n\in\mathbb{N}}\mathcal{U}_n$ is an ω-cover of X.

Can the term ``ω-shrinkable'' be removed from Sakai's characterization of the Pytkeev property of $C_p(X)$?

背景链接：https://arxiv.org/abs/math/0312182

16140 | AMR-134-0045

Selection Principles Milestone Problems - Problem 46 ([SakaiRez, Question 2.9])

O / open | AMR 问题清单汇编

If all finite powers of X satisfy $\mathsf{U}_{\mathrm{fin}}(\Gamma,\Gamma)$, then every open ω-cover of X is ω-shrinkable [SakaiRez], thus a positive solution to the following problem would suffice.

Assume that $C_p(X)$ is a Pytkeev space. Is it true that all finite powers of X satisfy $\mathsf{U}_{\mathrm{fin}}(\Gamma,\Gamma)$?

For generalized trees of size κ, is $\kappa^\kappa=\kappa$ necessary for embeddability to be strongly invariantly universal among κ-analytic quasi-orders? For singular κ, what is the descriptive-set-theoretic complexity of embeddability on $\operatorname{Mod}_\kappa(\varphi)$, and can it consistently be strongly invariantly universal? Can generalized trees be replaced by linear orders or groups while preserving strong invariant universality?

16176 | AIM-LOGIC-0115

A bounded-existential MRDP fragment and a certificate-growth audit

P / partially_solved | AIM 研讨会问题汇编

Is DPRM a theorem of \(I\Delta_0\)? Given a \(\Sigma_1\) formula \(\psi(\bar x)\), does there exist a polynomial \(P(\bar x,\bar y)\) such that \[I\Delta_0\vdash (\forall\bar x)\bigl(\psi(\bar x)\leftrightarrow (\exists\bar y)(P(\bar x,\bar y)=0)\bigr)? \]

Poonen and T. Scanlon and recorded by J. Demeyer. On page 1, Question 2 is attributed to P. D'Aquino.

The PDF immediately adds that a positive answer would imply \(\mathsf{NP}=\mathsf{coNP}\), and then says \[L=\{+,\cdot,0,1,\#,\leq\},\qquad \#(x,y):=x^{\lfloor\log y\rfloor}. Thus this is **not literally** the more common Buss smash notation \(x\#y=2^{|x||y|}\), although the two functions have comparable bit-growth. The PDF does not state the logarithm base or the convention at \(y=0\). Base 2 is the bounded-arithmetic convention; the isolated boundary value can be fixed by an axiom without affecting any result below.

The induction schema printed in the source suppresses parameters. The standard recovered form is \[\bigl[\varphi(0,\bar a)\wedge \forall x\bigl(\varphi(x,\bar a)\to\varphi(x+1,\bar a)\bigr)\bigr] \to\forall x\,\varphi(x,\bar a), \] for each bounded (\(\Delta_0\)) formula \(\varphi\).

There is a genuine source ambiguity. The question first names ordinary \(I\Delta_0\), whose usual language is \(L_{\rm ar}=\{0,1,+,\cdot,\leq\}\), and only after the displayed MRDP scheme introduces \(\#\). Adding a total function with the stated graph is not automatically a definitional extension of \(I\Delta_0\): its totality is a growth principle of the \(\Omega_1\) type. Accordingly, this report separates:

1. the pure \(I\Delta_0\) question in \(L_{\rm ar}\); and 2. an expanded-language variant in which \(\#(x,y)=x^{\lfloor\log_2 y\rfloor}\) is total and appropriately axiomatized.

Question 11. Let \(\mathcal A=HF(\mathbb C)\), and suppose \(K\cong\mathbb C\) is \(\Sigma\)-definable in \(\mathcal A\). Is there a \(\Sigma\)-definable isomorphism?

The answer is yes if we replace \(\mathbb C\) by \(\mathbb R\) and both \((K,\oplus,\odot)\cong\mathbb R\) and \(K\subseteq\mathbb R\) hold. It is open if merely \(K\subseteq\mathbb R^2\).

来源字段：https://aimath.org/pastworkshops/computestabproblems.pdf

16186 | AIM-LOGIC-0042

A forcing-axiom sieve and countable-condition reduction at omega two

P / partially_solved | AIM 研讨会问题汇编

$\kappa \rightarrow (\alpha,\beta)^n$ means that for every coloring $F:[\kappa]^n \rightarrow \{0,1\}$, then then there is either a homogeneous set H_0 of order-type α such that $F"H_0=\{0\}$, or else a homogeneous set H_1 such that $F"H_1=\{1\}$.

Can $\omega_2 \rightarrow (\omega_2,\alpha)^2$ be deduced from one of the forcing axioms at $\aleph_2$.

The record also remarks that PFA implies $\omega_1\rightarrow(\omega_1,\alpha)^2$ for every $\alpha<\omega_1$.

This text has four formulation defects, which are preserved above rather than silently corrected:

1. “then” is duplicated; 2. $F"H_i$ is not the restriction of a map whose domain is $[\kappa]^n$; 3. the order type β of H_1 is omitted; 4. α is free in the final question, and “one of the forcing axioms at $\aleph_2$” does not name a theory or a class of posets.

The standard repaired definition is \[\kappa\longrightarrow(\alpha,\beta)^n \] iff every $c:[\kappa]^n\to2$ admits either $H_0\subseteq\kappa$ with $\operatorname{otp}(H_0)=\alpha$ and $c``[H_0]^n=\{0\}$, or $H_1\subseteq\kappa$ with $\operatorname{otp}(H_1)=\beta$ and $c``[H_1]^n=\{1\}$.

Dilip Raghavan's contribution asks whether, relative to large cardinals, it is consistent that \[\mathsf{CH}+\mathsf S_{\omega_2},\qquad \mathsf S_{\omega_2}:= \forall\alpha<\omega_2\, [\omega_2\longrightarrow(\omega_2,\alpha)^2]. \tag{S} \] Thus (S), with $\alpha<\omega_2$, is the best-verified intended mathematical target. The workshop statement is a consistency question; the problem-list version asks the stronger and less determinate program of deriving (S) from a specified higher forcing axiom. These are kept distinct below.

An existential reading (“for some α”) cannot be the intended question: ZFC already gives $\omega_2\to(\omega_2,\omega+1)^2$, hence all smaller second targets. A literal reading with a free variable is not a sentence.

16193 | AIM-LOGIC-0135

A Prym criterion for rank preservation under Denef base change

P / partially_solved | AIM 研讨会问题汇编

Question 22 (Zahidi). Look at the Denef curve \[E:\quad f(t)Y^2=f(X), \] where \(f\) is a cubic. If we choose the curve in a good way, then \(E(k(t))\) has rank \(1\). Define \[E_u:\quad f(u)Y^2=f(X). \] Try to give conditions on \(u\in k(t)\) such that \(E_u(k(t))\) also has rank \(1\).

The source does not specify the characteristic, separability of \(f\), or what “in a good way” means. The standard Denef setting supplies the missing hypotheses: \(k\) has characteristic zero (more generally, most of the geometry below only needs characteristic different from \(2\)); \(f\in k[x]\) is a separable cubic; and the elliptic curve \[E_0:\quad y^2=f(x) \] has no \(k\)-endomorphisms beyond the integers. A sufficient standard condition for the last assertion is \(\operatorname{End}_{\bar k}(E_0)=\mathbb Z\), i.e. no complex multiplication.

This report works in characteristic zero and assumes \(f\) separable. It states separately whenever the hypothesis \(\operatorname{End}_k(E_0)=\mathbb Z\) is used.

No finite-generation hypothesis on \(k\) is needed for the rank formula itself. The anti-invariant constant maps are only the finite group \(E_0[2](k)\), while Hom groups of abelian varieties are finitely generated free abelian groups. Number-field or finitely-generated-field hypotheses enter only in the cited Hilbert-subset and effective isogeny tests.

16194 | AIM-LOGIC-0039

A reflection criterion for small Hausdorff spaces of spread omega_1

P / partially_solved | AIM 研讨会问题汇编

Do any of the analogs of PFA at \(\aleph_2\) give us \(\lvert X\rvert\leq 2^{\aleph_1}\) for every Hausdorff space with no discrete subspaces of size \(\aleph_2\)?

The stored item has no remarks or literature field. The official workshop report confirms the intended informal context: Neeman lectured on side-condition methods and “higher analogues of PFA,” while Todorčević discussed potential applications of those analogues to topology and combinatorics [AIM16]. The report does not identify a single formal axiom that can be substituted for the plural phrase in the problem.

The immediately preceding item 1.5 defines \[s(X)=\sup\{\lvert D\rvert:D\subseteq X\text{ is a discrete subspace}\} \] and asks when the ZFC bound \(\lvert X\rvert\leq 2^{2^{s(X)}}\) can be improved to \(2^{s(X)}\). Its literature note contains an internal conflict: it says both that PFA gives a “negative” answer for \(s(X)=\aleph_0\) and that PFA gives the positive bound \(\lvert X\rvert\leq 2^{\aleph_0}\) when there is no uncountable discrete subspace.

The topological convention in item 1.55 is unambiguous. Every subset of a discrete subspace is discrete. Thus a space has no discrete subspace of cardinality \(\omega_2\) if and only if every discrete subspace has size at most \(\omega_1\), equivalently \[s(X)\leq\omega_1. \] This equivalence does not require the supremum defining spread to be attained.

“Analogs of PFA at \(\aleph_2\)” has at least three plausible readings that must not be conflated:

1. the unnamed Neeman-style two-type side-condition principles contemplated at the 2016 workshop; 2. axioms meeting \(\omega_2\) dense sets for closed or specially restricted forcing classes, including principles discussed in nearby AIM items and [TX26]; 3. the later formal \(\omega_1\)-Strongly Proper Forcing Axiom, the \(\kappa=\omega_1\) instance of [ACKW19], for \(\omega_1\)-lattice, \(\omega_1\)-strongly proper posets and families of \(\omega_2\) dense open sets.

The analysis below assumes no equivalence or implication among these readings.

A weak-square counterexample and the width-escape mechanism

S / solved | AIM 研讨会问题汇编

Suppose $\forall n<\omega$, $kappa_n$ has the super tree property property. If $\lambda = \sup_{n<\omega}$, does λ^+ have the tree property?

This text is visibly corrupted in three places: `kappa_n` has lost the backslash of `\kappa_n`; “property” is duplicated; and the expression after the supremum sign has been dropped. These neighboring records support the following high-confidence reconstruction:

It is nevertheless reinforced by Hayut and Unger's paper, whose main ideas were conceived at the same January 2016 AIM workshop and whose main theorem addresses exactly this configuration. The counterexample below also works if “increasing” was not intended, since the exhibited sequence is increasing.

Borel completeness after naming a constant

P / partially_solved | AIM 研讨会问题汇编

Question 24. Suppose ∼=T is Borel complete. Is ∼=T ′ Borel complete?

Question 23. Let \(T'\) be an expansion of \(T\) by one constant. Suppose \(\cong_{T'}\) is Borel complete. Is \(\cong_T\) Borel complete?

Question 24. Suppose \(\cong_T\) is Borel complete. Is \(\cong_{T'}\) Borel complete?

The original AIM PDF and the preceding record recover the notation and the omitted setup:

Thus “∼=T” is \(\cong_T\), the isomorphism relation on countable models of \(T\), and “T ′” is \(T'\). Question 24 asks whether Borel completeness can be **lost** by naming one constant.

There is a small but important formulation ambiguity. “Expansion by one constant” could mean merely adding an unconstrained constant symbol to the language, but the standard formulation in later specialist sources is the following. Choose \(M\models T\) and \(a\in M\), put

\[p(x)=\operatorname{tp}^M(a/\varnothing), \]

\[T_p=\operatorname{Th}(M,a)=T\cup p(c) \]

in \(L\cup\{c\}\). This is a complete theory. The report analyzes this standard naming-a-parameter reading and writes \(T'=T_p\). It does not silently claim that every other incomplete use of “expansion” is equivalent.

16246 | AIM-LOGIC-0025

Consistency bounds and a width obstruction for two merged inner-model questions

P / partially_solved | AIM 研讨会问题汇编

Question 8. What is the consistency strength of \[MM(\mathfrak c)? \] The printed annotations give \(AD_{\mathbb R}+\) “\(\Theta\) is regular” as an upper bound (via Woodin's \(\mathbb P_{\max}\) analysis) and \(AD^{L(\mathbb R)}\) as a safe lower bound (Steel--Zoble).

Question 9. What is the consistency strength of \[T_9:=\mathsf{ZFC}+\neg\square_{\omega _2}+\neg\square(\omega _2) +2^{\omega _1}=\omega _2? \] The source then says that the upper bound is weaker than \(AD_{\mathbb R}+\) “\(\Theta\) is Mahlo” and displays the shorthand \[\{\alpha\mid \operatorname{cof}(\theta_\alpha)\geq\aleph_2 +\theta_\alpha\text{ regular in HOD}\}. \] This displayed set is not by itself a complete theory: in particular, the PDF does not state there whether it is to be stationary or merely unbounded, and the plus sign is being used informally as conjunction. It is therefore preserved as a source annotation rather than silently replaced by a later precise hypothesis. The 2017 theorem stated in Section 2 below is the rigorous published update.

来源字段：https://aimath.org/pastworkshops/innermodelproblems.pdf

16247 | AIM-LOGIC-0037

Consistency of the lightface Sigma_1 maximality scheme

S / solved | AIM 研讨会问题汇编

The following is inconsistent: “For every \(\Sigma_1\) statement \(\varphi\) with \(\aleph_1\) and \(\aleph_2\) as parameters, if \(\varphi\) can be forced by an \(\aleph_1,\aleph_2\)-preserving forcing, then \(\varphi\) holds.”

The current AIM page agrees verbatim with the repository record and supplies no attribution, definitions, remarks, or status update.

1. \(\Sigma_1\) is read in the full-universe Lévy hierarchy: \(\varphi(a,b)\) has the form \(\exists x\,\theta(x,a,b)\), where every quantifier of \(\theta\) is bounded. 2. The only allowed parameters are the two cardinal constants \(\omega_1\) and \(\omega_2\), not arbitrary elements of \(H_{\omega_3}\). 3. A forcing is \((\omega_1,\omega_2)\)-preserving when it forces the ground-model \(\omega_1\) and \(\omega_2\) to remain, respectively, the first and second uncountable cardinals. 4. The assertion is a first-order **scheme**, one instance for each syntactic \(\Sigma_1\) formula; it is not a single formula quantifying over truth.

Let \(\Gamma_2\) denote this definable class of set forcings. The recovered scheme is \[\mathsf{LMP}^{\Sigma_1}_2:\qquad \bigl[\Diamond_{\Gamma_2}\varphi(\omega_1,\omega_2)\bigr] \longrightarrow\varphi(\omega_1,\omega_2) \] for every full-universe \(\Sigma_1\) formula \(\varphi\), where \(\Diamond_{\Gamma_2}\) means “true in some \(\Gamma_2\)-forcing extension.”

Under this standard reading, the AIM conjecture is false: the scheme is equiconsistent with ZFC.

16253 | AIM-LOGIC-0010

Decidability of C(t) with a named coordinate or derivation

P / partially_solved | AIM 研讨会问题汇编

Its earliest available capture, dated 10 December 2019, and a 7 December 2023 capture have the same archived content digest and contain exactly the displayed wording.

The source leaves the signature implicit. Nearby AIM problems explicitly use the language of rings and list its operations together with named coordinates. The standard reconstruction of the first clause is therefore \[L_t=L_{\mathrm{ring}}\cup\{\tau\}, \qquad L_{\mathrm{ring}}=\{0,1,+,-,\cdot\}, \qquad \tau^{\mathbb C(t)}=t. \] Here “with \(1\) and \(t\)” is shorthand for the ring language with the displayed distinguished constants, not a two-symbol language without ring operations.

There are two coherent readings of the second clause.

1. **One-variable reading:** add the unary function \(D=d/dt\) to \(\mathbb C(t)\), with \(i=1\). 2. **Multivariable reading:** replace the field by \(\mathbb C(t_1,\ldots,t_n)\) and add all standard commuting partial derivations \(D_i=\partial/\partial t_i\).

The official 2019 workshop report supports the second explanation: it discusses defining \(k[x_1,\ldots,x_n]\) in \(k(x_1,\ldots,x_n)\) after all \(\partial/\partial x_i\) are added to the language. It does not repair the wording of Problem 3.2, so both readings are analyzed below.

Diophantine additive polynomials and the failure of finite Artin--Schreier tests

S / solved | AIM 研讨会问题汇编

Question 5 (Pheidas). An additive polynomial in \(\mathbb F_p[Z]\) is a polynomial of the form \[F(Z)=\alpha _0Z+\alpha _1Z^p+\alpha _2Z^{p^2}+\cdots+\alpha _nZ^{p^n}, \qquad \alpha_i\in\mathbb F_p. \] These are the polynomials that satisfy \(f(A+B)=f(A)+f(B)\) for all \(A,B\in\mathbb F_p[Z]\). Can we Diophantinely define the additive polynomials?

I checked page 2 of the official 2005 AIM problem-list PDF. Question 5 is:

Demeyer's comment then rejects the following proposed hierarchy: \[\begin{aligned} F&=(A^p-A)+\alpha Z,\\ F^2&=(B^p-B)+\beta Z+(C^p-C)Z+\gamma Z^2,\\ F^3&=(L^p-L)+\lambda Z+(M^p-M)Z+\mu Z^2 +(N^p-N)Z^2+\nu Z^3, \end{aligned} \tag{1} \] with witnesses \(A,B,C,L,M,N\in\mathbb F_p[Z]\) and \(\alpha,\beta,\gamma,\lambda,\mu,\nu\in\mathbb F_p\), continued through an ordinary power \(F^n\). The PDF's displayed nonadditive counterexample is \[H(Z)=\sum_{i=0}^{p-1}\left(Z^{2p}-Z^{p+1}\right)^{p^i}. \]

It concerns the noncommutative ring \(\mathcal A_L\) of additive polynomials over a field \(L\) of characteristic \(p\), with addition and composition, and the centralizer equation \[f\circ Z^p=Z^p\circ f. \tag{3} \] It is connected to Question 5 because Question 5 seeks the additive-polynomial subset inside an ordinary commutative polynomial ring, while Fact 6 starts with the additive-polynomial composition ring as its ambient structure.

Effective cocycle criterion for reconstructing a central finite cover

P / partially_solved | AIM 研讨会问题汇编

Question 4. How difficult is it to find a presentation of M in terms of G?

Let M be a strongly minimal nontrivial locally modular structure. There is a nonorthogonal interpretable strongly minimal group G.

Consider a three-to-one map $(\mathbb Q,+)\leftarrow(M,\oplus)$ where $(M,\oplus)$ is strongly minimal.

The immediately preceding source text says:

Inspection of the original PDF resolves the segmentation. The three-to-one paragraph follows Question 4 as a new paragraph, and Question 5 immediately asks whether the operation $\oplus$ is definable in some $\mathbb Q\times F$. Thus the paragraph introduces the notation used by Question 5. It is useful context about finite covers, but it is not part of the sentence constituting Question 4. This report owns and analyzes only Question 4.

The phrase “a presentation of M in terms of G” is not formally defined in the source. Three inequivalent readings must be separated:

1. **Existential:** does the isomorphism type of M have a computable copy whenever G does? 2. **Relative to a cover:** from a copy of G and fixed data describing $M\to G$, can one compute a copy of the cover, including the map? 3. **Uniform/functorial:** is there a single computable procedure on copies and isomorphisms of G that constructs copies of M? Equivalently, under the usual hypotheses, is M effectively interpretable in G?

The results below show that these readings can differ even for elementary finite group covers.

16283 | AIM-LOGIC-0081

Effective presentations of interpreted groups and a constant-fiber no-jump criterion

P / partially_solved | AIM 研讨会问题汇编

The original AIM problem list places Question 3 in the following section:

The next two questions ask conversely for a presentation of \(M\) from \(G\), and then discuss a three-to-one map from a strongly minimal group \((M,\oplus)\) to \((\mathbb Q,+)\). This confirms that “presentation” is meant in the computable-model-theoretic sense and that finite covers/quotients are central.

The wording is intentionally qualitative and omits three choices that materially change the answer:

1. whether an interpretation scheme (domain, quotient equality, and group-law formulas) is supplied or must be discovered; 2. whether its finite parameter tuple is supplied or must be selected uniformly from a copy of \(M\); 3. whether “in terms of” asks only for some copy of \(G\), or for a uniform quotient map/functor compatible with copies and isomorphisms.

This report makes those choices explicit rather than silently replacing the question by one formalization.

来源字段：https://aimath.org/WWN/hilberts10th/hilberts10th.pdf

16285 | AIM-LOGIC-0124

Effective simple-set transfer and an obstruction from noneffective localizations

P / partially_solved | AIM 研讨会问题汇编

It first recalls that a set \(A\subseteq\mathbb N\) is **simple** when

1. \(A\) is computably enumerable (c.e., called r.e. in the source); 2. \(\mathbb N\setminus A\) is infinite; and 3. every c.e. subset of \(\mathbb N\setminus A\) is finite.

It then proposes the following transfer. Let \(\mathcal O_K\) be a ring of integers, let \(f:\mathcal O_K\hookrightarrow R\) be a ring embedding, and suppose a simple subset is represented by \[A=\{x\in\mathcal O_K:\exists\mathbf y\in\mathcal O_K^n, P(x,\mathbf y)=0\}. \] Allowing witnesses in \(R\) gives a larger set, asserted to be either simple or cofinite. The stated application is: if \(P\in\mathbb Z[x,\mathbf y]\) defines a simple set using integral witnesses and the set obtained using rational witnesses has infinite complement in \(\mathbb Z\), then Hilbert's tenth problem over \(\mathbb Q\) is undecidable.

* It defines the enlarged set with \(x\in\mathcal O_K\), but then writes \(f(A)\subseteq A'\), comparing a subset of \(R\) with a subset of \(\mathcal O_K\). The type-correct pullback is \[B_{R,f}=\{x\in\mathcal O_K:\exists\mathbf y\in R^n, P^f(x),\mathbf y)=0\}, \tag{1} \] where \(P^f\) is obtained by applying \(f\) to the coefficients. Then \(A\subseteq B_{R,f}\). Equivalently one may work with \(f(B_{R,f})\subseteq f(\mathcal O_K)\). * “Computably enumerable” is meaningful only relative to an effective presentation. An abstract ring embedding does not ensure that the pullback (1) is c.e. This missing hypothesis is essential; Section 7 gives an explicit counterexample to that preservation step.

Do the known classifications for finitely generated virtually free groups extend from $\forall\exists$-formulas to arbitrary first-order formulas? More precisely, can elementary equivalence still be characterized by common overgroups obtained through finite sequences of legal large HNN extensions over finite subgroups and legal small replacements of virtually cyclic subgroups, can elementary embeddings still be characterized by iterated legal large extensions, and do the corresponding decision algorithms still exist?

16372 | AIM-LOGIC-0024

Mutual stationarity, forcing axioms, and universally Baire absoluteness

P / partially_solved | AIM 研讨会问题汇编

The exact repository `problem` field is:

The exact repository `remarks` entry is:

Thus the printed sentence is ungrammatical. The following is the **recovered statement**, with the single insertion marked by brackets.

Is it consistent that for every sequence \[\langle S_n\mid n\in\omega\rangle, \qquad S_n\subseteq\aleph_{n+2}\cap\operatorname{cof}(\omega_1), \] with each \(S_n\) **[stationary]**, the sequence is mutually stationary?

The insertion is supported in two independent ways. First, Proposition 5.1 below proves that mutual stationarity forces every component to be stationary, so without the insertion the assertion is immediately false (take an empty component). Second, Ben-Neria restates exactly this question, with indices \(2\leq m<\omega\), and explicitly says “stationary sets.”

The PDF records a Koepke--Welch lower bound: the assertion yields an inner model with infinitely many cardinals \(\kappa_n\) such that, for \(n>m\), the class of measurable \(\lambda<\kappa_n\) of Mitchell order at least \(\kappa_m\) is stationary in \(\kappa_n\) (the workshop shorthand says “stationary in \(V\)”).

Is \(\mathsf{MM}(\mathfrak c^+)\) consistent with Woodin's axiom \((*)\)? Here \(\mathsf{MM}(\kappa)\) is the restriction of Martin's Maximum to stationary-set-preserving partial orders of size at most \(\kappa\). The queried axiom is \(\mathsf{MM}(\mathfrak c^+)\), not \(\mathsf{MM}^{++}\).

Assume a proper class of Woodin cardinals and \(\mathsf{MM}^{++}\). Suppose that for every forcing \(\mathbb P\), \[\operatorname{Th}\bigl(L(\Gamma_{\mathrm{uB}})\bigr) = \operatorname{Th}\bigl(L(\Gamma_{\mathrm{uB}})\bigr)^{V^{\mathbb P}}, \] in a language with a constant symbol for every ground-model universally Baire set (interpreted canonically in the extension). Does this imply \[\operatorname{cf}(\theta_{\mathrm{uB}})>\aleph_1? \] Here \(\Gamma_{\mathrm{uB}}\), also denoted \(\Gamma^\infty\), is the collection of universally Baire sets, and \(\theta_{\mathrm{uB}}\) denotes the length/supremum of their Wadge hierarchy in the workshop notation. The PDF reports that, assuming in addition weak UBH, the desired cofinality statement is equivalent to the existence of a semiproper forcing adding a universally Baire set strictly Wadge-above every ground-model universally Baire set.

Remark 1 uses \((*)^+\) for the assertion that every \(A\subseteq\mathbb R\) is captured in a \(\mathbb P_{\max}\)-generic extension \(M[g]\) of an \(\mathsf{AD}^+\)-model \(M\supseteq\mathbb R\). The displayed \((*)^{++}\) strengthens the requirement on this \(M\) to \(M\models\mathsf{AD}_{\mathbb R}+\)“\(\Theta\) is regular.” The workshop notes report \[\mathsf{MM}^{++}+(*)^{++}\Longrightarrow\theta_{\mathrm{uB}}=\omega_3. \]

One-equation reductions for the rational Hamilton quaternions and Lipschitz order

P / partially_solved | AIM 研讨会问题汇编

\[H=(-1,-1)_{\mathbb Q} =\mathbb Q\oplus i\mathbb Q\oplus j\mathbb Q\oplus k\mathbb Q, \qquad i^2=j^2=k^2=ijk=-1, \]

be the Hamilton quaternion division algebra over \(\mathbb Q\), and let

\[O=\mathbb Z+i\mathbb Z+j\mathbb Z+k\mathbb Z \]

be its Lipschitz order. Is there an algorithm deciding whether one noncommutative polynomial equation has a solution in each of the following four coefficient/domain combinations?

1. coefficients in \(\mathbb Q\), solutions in \(H\); 2. coefficients in \(\mathbb Q\), solutions in \(O\); 3. coefficients in \(H\), solutions in \(H\); 4. coefficients in \(H\), solutions in \(O\).

The note then asks whether \(\mathbb Z\) is existentially definable in \(O\) and proposes

\[x\in\mathbb Z\quad\Longleftrightarrow\quad (\exists I,J,K)\bigl(I^2=-1\wedge J^2=-1\wedge IJ=-JI \wedge xI=Ix\wedge xJ=Jx\bigr). \tag{1.1} \]

It says that this was “very likely done by D. Tunc,” suggests that the analogous definition of \(\mathbb Q\) in \(H\) makes (1) and (3) equivalent to Hilbert's tenth problem over \(\mathbb Q\), and asks the same questions for \(M_n(\mathbb Z)\) and \(M_n(\mathbb Q)\).

The expression after part (2), `PROBLEMS RELATED TO ... 3`, is a page header; the displayed `I2` and `J2` are \(I^2\) and \(J^2\); and `Mn` is \(M_n\). The PDF itself spells the name “D. Tunc.” The variable \(K\) really is quantified but is unused.

16381 | AIM-LOGIC-0085

One-jump selection and a pure-equality obstruction for the definition map

P / partially_solved | AIM 研讨会问题汇编

Question 7. How complicated is the map ϕ 7 → dpϕ (possibly with uniformity in p)?

Question 7. How complicated is the map \[\varphi\longmapsto d_p\varphi \] (possibly with uniformity in \(p\))?

Inspection of the original AIM PDF shows that the intended typography is

The question occurs in the section “Continuous sections (Miller).” Immediately before Questions 6-8, the source says that for a stable theory \(T\) and \(M\preccurlyeq N\models T\), restriction \(S_1(N)\to S_1(M)\) has a continuous section sending \(p\) to its unique nonforking extension.

For a formula \(\varphi(x;y)\) and \(p\in S_x(M)\), a \(\varphi\)-definition of \(p\) is an \(M\)-formula \(d_p\varphi(y)\) such that

\[M\models d_p\varphi(b) \quad\Longleftrightarrow\quad \varphi(x;b)\in p \qquad (b\in M^{|y|}). \]

1. how \(M\) and \(p\) are represented; 2. whether the output is the semantic trace \(b\mapsto\mathbf 1_{\varphi(x;b)\in p}\) or a finite formula code defining that trace; 3. whether a fixed \(p\) is allowed as an oracle, or one functional must work uniformly for all \(p\).

The results below use the standard oracle presentation: formulas with parameters from a countable \(M\) are effectively coded, \(p\) is given by its characteristic function on such formulas, and the elementary diagram \(\operatorname{ElDiag}(M)\) is available as an oracle.

However, for non-well-ordered cardinals, the situation deteriorates quickly. The sequel is the following. For such a theory T, we want to show it is very close to a stongly minimal T'. It is like a vector space over fixed field or algebraically closed field. And since there is no well order, it is hard to take a basis and match them to one another. So there is the question.

For vector space over fixed $\mathbb{K}$, is choose a basis require the full Axiom of Choice?

Ceer stands for computably enumerable equivalence relation on ω. A diagonal function (or a fixed-point-free function) for a ceer E is a total function $g(x)$ satisfying $\neg g(x) E x$ for all $x \in \omega$.

The following are three versions of this problem.

- Describe the class **Diag** containing those Turing degrees d such that every ceer $E \neq \text{Id}_1$ admits a d-computable diagonal function. Here we have some partial results:

- $\text{**PA**} \subseteq \text{**Diag**} \subseteq \text{**DNR**}$ [Badaev, Bazhenov, Kalmurzayev, Mustafa 2024].

- There exists a Martin-Löf random x such that $x \notin \text{**Diag**}$ [Ng].

- What is the reverse-mathematical strength of the statement “Every Σ_1^0-definable equivalence relation $E \neq \text{Id}_1$ has a diagonal function”?

- What is the Weihrauch degree of the corresponding problem?

Positive-existential decoder criterion for rational pair storage

P / partially_solved | AIM 研讨会问题汇编

Jeroen Demeyer has observed that the existence of a polynomial bijection \(\mathbb N^2\to\mathbb N\) implies that any first order formula over \(\mathbb N\) in positive prenex form is equivalent to one in which every block of consecutive universal quantifiers is replaced by just one (and the number of existential quantifiers goes up). Such a polynomial bijection can be found in Davis, *Math. Monthly* **80**, 236--237. Does something similar work for \(\mathbb Q\), in other words, can we find a Diophantine injection \(\mathbb Q^2\hookrightarrow\mathbb Q\)? There are some observations related to this in *C.R.A.S. Paris* **328**, 3--8 (1999); for example, this would follow from the generalized \(abc\)-conjecture.

16470 | AIM-LOGIC-0027

Repair and resolution of a core-model covering problem

O / open | AIM 研讨会问题汇编

Recovered Problem 15. Suppose there is no inner model with a Woodin cardinal, and let \(\kappa\) be a **regular** cardinal in the core model \(K\). Suppose \(\kappa\) is a singular cardinal in \(V\). Must \(\kappa\) be measurable in \(K\)? For \(K\) below \(0^{\P}\), this is known (Cox).

Its exact `problem` field is preserved here:

The original PDF was rendered and inspected visually. It establishes three points.

1. The PDF itself, not merely the OCR, says that \(\kappa\) is “a singular cardinal in \(K\).” This is a source-level mathematical typo: a cardinal cannot be both singular and measurable in the same ZFC model. 2. The symbol in “below \(0\)” is a superscript pilcrow. In standard core-model notation it is \(0^{\P}\), read “zero pistol,” the sharp for an inner model with a strong cardinal. Thus the printed annotation is “For \(K\) below \(0^{\P}\) this is known (Cox).” 3. Footnote 4 belongs to the preceding printed Problem 14. Its marker follows “Must \(N^\#\) exist?” The footnote is physically placed beneath Problem 15 only because both occur at the bottom of the page. It is not a qualification of Problem 15 and is removed from the recovered statement.

The source-supported **recovered statement** is therefore:

The replacement “regular” is not claimed to be the logically unique imaginable edit. It is the unique single-word repair supported by the printed Cox annotation: Cox's main theorem has precisely “regular in \(K\), singular in \(V\)” as its covering configuration. It also removes the direct contradiction between “singular in \(K\)” and “measurable in \(K\).”

1.8. Standard systems of RCF (Marker).

Question 16. What are the possible standard systems of recursively saturated real closed fields? (This is essentially asking: What are the possible sets of cuts of \(\mathbb Q\) that are realized in some models?)

The ideal answer might be “all Scott sets”.

来源字段：https://aimath.org/pastworkshops/computestabproblems.pdf

16480 | AIM-LOGIC-0080

Scott-rank gaps above infinitary quantifier rank

S / solved | AIM 研讨会问题汇编

Page 2 of the original AIM PDF gives the complete question as follows:

The following Section 1.2 heading begins immediately after the question and is not part of it.

There are two important typographical points.

1. The logic is \(L_{\omega_1,\omega}\): countable conjunctions and disjunctions are allowed, but only finite strings of quantifiers occur along any branch of a formula. 2. The first displayed ordinal is the ordinary first uncountable ordinal \(\omega_1\), not the Church--Kleene ordinal \(\omega_1^{CK}\). This is especially clear from the PDF because the preceding definition in Question 1 explicitly prints a raised “\(CK\)” in \(\omega_1^{CK}\), whereas Question 2 prints only \(\omega_1\).

Scott rank is normally defined here only for countable structures in a countable language. Those are the conventions adopted below. They are also the conventions used in the later paper that resolves the question.

16483 | AIM-LOGIC-0129

Sharp integer-root bound for binomial-product programs and a tau-convention audit

P / partially_solved | AIM 研讨会问题汇编

Poonen and T. Scanlon and recorded by J. Demeyer. The official PDF, p.

\[1,x,g_1,g_2,\ldots, \]

with every \(g_i\) the sum, difference, or product of two earlier terms, defines

\[\tau(f)=\min\{n:\text{there is such a sequence with }g_n=f\}, \]

and asks for an absolute constant \(c\) such that, for every nonzero \(f\in\mathbb Z[x]\),

\[\#\{a\in\mathbb Z:f(a)=0\}\le (1+\tau(f))^c. \tag{1} \]

Thus the recovered typography is **\((1+\tau(f))^c\)**. “Number of integer zeros” is interpreted as the number of *distinct* integer zeros. Section 7 proves that counting multiplicity would make (1) false. As is standard, set \(\tau(1)=\tau(x)=0\); the literal minimum in the workshop sentence otherwise omits the two input polynomials.

The ordinary circuit convention permits the same earlier register to be used twice (in particular, squaring is one multiplication). Because “two earlier terms” might be read as requiring two distinct register positions, Section 7 also proves that the two conventions are polynomially equivalent with an explicit constant-factor bound.

16488 | AIM-LOGIC-0130

Simplex-supported feasibility over local and global fields

P / partially_solved | AIM 研讨会问题汇编

In particular, the displayed sum was read as a product, vector notation was flattened, and \(\mathbb Q_p^n\) was read as \(\mathbb Q^{np}\).

Let \(c_j\in\mathbb Z\), and let \[P(x_1,\ldots,x_n)=\sum_{j=0}^{n}c_jx^{a_j}, \qquad a_0,\ldots,a_n\in\mathbb N^n, \] where the exponent vectors are affinely independent. For fixed \(p\), can one decide in polynomial time whether \(P\) has a zero in \(\mathbb Q_p^n\)? The source records a negative complexity answer based on an encoding of \(0/1\)-knapsack, comments on the real analogue, and then asks whether one can decide the existence of a zero in \(\mathbb Q^n\). It notes that the latter contains the rational-solubility problem for diagonal genus-one curves \[ax^3+by^3=1. \]

The source numbers the terms from \(1\) to \(n+1\); this report shifts the indices to \(0,\ldots,n\). No mathematical content is changed. The complexity phrase “Answer: NO” cannot be an unconditional proof that no polynomial-time algorithm exists unless a complexity-class separation is supplied. The conservative reading is that the stated knapsack encoding gives NP-hardness, so polynomial time would imply \(\mathsf P=\mathsf{NP}\).

来源字段：https://aimath.org/WWN/hilberts10th/hilberts10th.pdf

16489 | AIM-LOGIC-0032

Simultaneous vanishing of the higher limits of the Mardesic-Prasolov system

P / partially_solved | AIM 研讨会问题汇编

Is it consistent with ZFC that \(\lim^p\mathbb A=0\) simultaneously for every positive integer \(p\)?

The supplied source URL is <http://aimpl.org/highlowforcing/1/>.

The record defines

\[\mathbb A=\langle A_f:f\in\omega^\omega\rangle, \qquad A_f=\bigoplus_{n\in\omega}\bigoplus_{i<f(n)}\mathbb Z =\bigoplus_{n\in\omega}\mathbb Z^{f(n)}, \]

introduces groups denoted by \(G_f\) and an augmented alternating complex beginning

\[\mathbb Z^{\omega\times\omega}/\mathrm{fin} \longrightarrow \prod_fG_f \longrightarrow \prod_{f_0\leq f_1}G_{f_0} \longrightarrow \prod_{f_0\leq f_1\leq f_2}G_{f_0} \longrightarrow\cdots, \]

The exact source text suppresses several conventions. They can be recovered from the primary literature as follows.

1. The order on \(\omega^\omega\) is the pointwise order: \(f\leq g\) iff \(f(n)\leq g(n)\) for every \(n\). If \(f\leq g\), the bonding map \(p_{gf}:A_g\to A_f\) is coordinate projection. 2. Put \(I_f=\{(n,i)\in\omega^2:i<f(n)\}\), \(B_f=\prod_{I_f}\mathbb Z\), and \(G_f=B_f/A_f\). Thus the ambiguous source expression \(\prod_n\mathbb Z^{f(n)}/\mathrm{fin}\) means functions on \(I_f\) modulo the subgroup of finitely supported functions, or equivalently equality except at finitely many pairs \((n,i)\). The bonding maps on \(B\) and \(G=B/A\) are restrictions. 3. Some papers use \(i\leq f(n)\) instead of \(i<f(n)\). Passing to the cofinal family of everywhere-positive functions, or shifting \(f\) by one, reconciles the conventions and does not change derived limits. 4. If \[C^{-1}=\mathbb Z^{\omega^2}/\mathrm{fin},\qquad C^q=\prod_{f_0\leq\cdots\leq f_q}G_{f_0}\quad(q\geq0), \] then the augmentation sends a global function to its restrictions modulo finite support. The full differential is \[(dc)(f_0,\ldots,f_{q+1})= p_{f_1f_0}c(f_1,\ldots,f_{q+1}) +\sum_{i=1}^{q+1}(-1)^i c(f_0,\ldots,\widehat{f_i},\ldots,f_{q+1}). \] The source's formula suppresses the restriction in the zeroth face. Equivalently, all faces are restricted to the common region \(I_{f_0}\).

The recovered question is therefore:

The qualifier “positive” is forced both by the modern theorem statements and by the degree-zero calculation proved below.

Stability, hereditary containment, and the exponent quantifier

P / partially_solved | AIM 研讨会问题汇编

Is there a notion of "explicitly defined norm" such that every Banach space with an explicitly defined norm hereditarily contains an \(\ell_p\) space?

Problem 28 reads:

It is followed by the background sentence saying that the working group on Definable Norms and Stable Banach Spaces studied the subject. The sentence beginning "29. Study asymtotic cones" is the next, independent problem and is not part of Problem 28.

The only corrections made here are typographical: "explictly" is read as "explicitly," and "lp" as the standard sequence space \(\ell_p\). Thus the recovered question is:

The historical working-group report makes the motivation more precise but also exposes two ambiguities. It asks for model-theoretic conditions on a separable infinite-dimensional Banach space \(X\) which ensure that every infinite-dimensional subspace contains one of the classical sequence spaces \(\ell_p\) or \(c_0\). The printed Problem 28 mentions only \(\ell_p\). Neither source says whether the same exponent \(p\) must work in all subspaces, nor whether "contains" means an isomorphic copy, an almost-isometric copy, or finite representability.

Strong-homology additivity and one universal earring test

P / partially_solved | AIM 研讨会问题汇编

Its exact `problem` field is:

The old statement about \(\mathfrak d\) is preserved exactly above, but Section 2 treats it as a historical heuristic rather than a theorem.

There are two scope distinctions that are essential to recovering the mathematical question.

1. **Additivity is Milnor's axiom.** For a class \(\mathcal C\), every family \(\{X_\alpha:\alpha\in I\}\) for which all \(X_\alpha\) and the topological coproduct \(\coprod_{\alpha\in I}X_\alpha\) belong to \(\mathcal C\) must induce isomorphisms \[\bigoplus_{\alpha\in I}\overline H_p(X_\alpha) \longrightarrow \overline H_p\!\left(\coprod_{\alpha\in I}X_\alpha\right) \quad(p\geq 0). \] This is not the group-law assertion suggested by the ordinary-language word “additive.” 2. **The general clause includes nonseparable spaces.** Every closed subspace of a finite-dimensional Euclidean space is locally compact and separable metrizable, but an arbitrary locally compact metric space need not be separable and may have arbitrarily large weight. The modern solution separates these cases.

The literature used below works with the standard integral strong homology groups \(\overline H_p(-;\mathbb Z)\); that coefficient convention is adopted throughout. No assertion is made here that the same consistency statement simultaneously holds for every coefficient group. Strong homology agrees with Steenrod homology on metric compacta but is a different extension beyond compacta; it is not silently replaced by singular, Steenrod--Sitnikov, or Borel--Moore homology.

The super tree property at aleph_{omega+1} and the missing assignment quantifier

S / solved | AIM 研讨会问题汇编

Can we obtain the super tree property at $\aleph_{\omega+1}$?

The AIM record (workshop *High and low forcing*, section “Problems in High Forcing,” Problem 2.35) defines a thin (κ,λ)-tree as a set

$$ F\subseteq\{f:x\to2\mid x\in P_\kappa(\lambda)\} $$

that is closed under restriction, has a nonempty level $\operatorname{Lev}_x(F)=\{f\in F:\operatorname{dom}(f)=x\}$ for every $x\in P_\kappa(\lambda)$, and satisfies $|\operatorname{Lev}_x(F)|<\kappa$. It defines a cofinal branch as a function $b:\lambda\to2$ whose restriction to every $x\in P_\kappa(\lambda)$ lies on the x-level. Given a level assignment

$$ \vec f=\langle f_x:x\in P_\kappa(\lambda)\rangle, \qquad f_x\in\operatorname{Lev}_x(F), $$

it calls b ineffable when

$$ S(F,\vec f,b)=\{x\in P_\kappa(\lambda):b\mathbin{\upharpoonright}x=f_x\} $$

is stationary. It then asks:

Here $P_\kappa(\lambda)=\{x\subseteq\lambda:|x|<\kappa\}$, and stationarity is with respect to the club filter on this set.

The displayed tree definition is mathematically coherent; `\upharpoonleft` in its first clause is a harmless restriction-symbol variant. The final definition, however, leaves the level assignment free. The standard and literature-confirmed reconstruction is

$$ \boxed{ \forall\lambda\geq\kappa\ \forall F\ \forall\vec f\ \exists b:\lambda\to2\quad S(F,\vec f,b)\text{ is stationary}}, $$

where F ranges over thin (κ,λ)-trees and $\vec f$ ranges over all level assignments for F. The universal quantifier over assignments is essential, not stylistic: Section 5 below proves that replacing it by an existential quantifier collapses the purported super tree property exactly to the strong tree property.

Welch games and the cofinality threshold for terminal extension

P / partially_solved | AIM 研讨会问题汇编

The formal definition in Foreman--Magidor--Zeman (FMZ) is as follows.

A **\(\kappa\)-algebra** is a \(\kappa\)-complete Boolean subalgebra \(\mathcal A\subseteq\mathcal P(\kappa)\) of cardinality \(\kappa\). In the Welch game \(G^W_\gamma(\kappa)\), at every stage \(\alpha<\gamma\), Player I plays \(\mathcal A_\alpha\), extending all earlier algebras, and Player II responds with a uniform \(\kappa\)-complete ultrafilter \(U_\alpha\) on \(\mathcal A_\alpha\), extending all earlier \(U_\beta\). One may require without loss that \(\mathcal A_0\) contain all singletons. Player I moves first at limit stages. Player II wins exactly when legal responses are made at every stage below \(\gamma\).

FMZ also define, for limit \(\gamma\), a stronger terminal payoff \(Q_\gamma\). The corresponding game \(G^*_\gamma\) has the same moves, but Player II wins a full run only when all the \(U_\alpha\)'s have a common uniform \(\kappa\)-complete-ultrafilter extension on the \(\kappa\)-complete Boolean algebra generated by \(\bigcup_{\alpha<\gamma}\mathcal A_\alpha\).

1. the algebras are concrete subalgebras of \(\mathcal P(\kappa)\), have size \(\kappa\), and form an increasing chain; 2. Player II's objects are **uniform ultrafilters**, not arbitrary filters; 3. the ultrafilters must extend one another; and 4. the first literature bullet needs a large-cardinal hypothesis: the length-\(\omega\) winning-strategy statement is the weak-compactness characterization, not an unconditional fact about every regular \(\kappa\).

What a computable nonforking section computes

P / partially_solved | AIM 研讨会问题汇编

Inspection of page 2 of the original AIM problem-session PDF shows that the material beginning “1.4.

The complete relevant source context is Section 1.3, “Continuous sections (Miller)”:

Thus “computable section” in Question 8 refers to a section \[s=s^{\mathrm{nf}}_{M,N}:S_1(M)\longrightarrow S_1(N) \] of restriction \(r:S_1(N)\to S_1(M)\), where \(s(p)\) is the unique nonforking extension of \(p\) from \(M\) to \(N\). The PDF does not specify representations of models, formula algebras, or points of the Stone spaces. Without such data, “computable” has no invariant formal meaning. The results below therefore state an explicit effective coding convention.

16574 | AIM-COMPUTATION-0022

A binary-collapse-invisible likelihood face

S / solved | AIM 研讨会问题汇编

Maximum likelihood estimates for an $I\times J\times K$ table under the no 3-way interaction model do not exist if and only if they do not exist for all collapsings of the table to a $2\times2\times2$ table.

The official PDF says:

It immediately adds that Nicholas Eriksson showed later in the week that the conjecture is false already for $3\times3\times3$ tables. It then records Mathias Drton's question about structural zeros and Stephen Roehrig's question about decomposable network flows. The isolated line “Akimichi Takemura” after those questions is the speaker heading for Question 9, not an attribution or a condition attached to Conjecture 8. This boundary was checked directly in the official PDF.

There is a genuine quantifier issue. Read literally, the displayed sentence is

$$ \operatorname{NoMLE}(n) \quad\Longleftrightarrow\quad \text{for every binary collapse }\pi, \operatorname{NoMLE}(\pi n). \tag{1.1} $$

That universal statement is false already for a $2\times2\times3$ table; Proposition 5.4 below gives a two-line example. The contemporaneous paper of Eriksson--Fienberg--Rinaldo--Sullivant (EFRS), together with the workshop's claim that the first failure is at 3^3, identifies the mathematically substantive intended reading as the **detection formulation**

$$ \operatorname{NoMLE}(n) \quad\Longleftrightarrow\quad \text{there exists at least one binary collapse }\pi \text{ with }\operatorname{NoMLE}(\pi n). \tag{1.2} $$

In other words, one tests the whole family of collapses in order to find a witness; one does not require every member of that family to fail. Formula (1.2) is equivalent to asking whether all relevant facets of the large marginal cone are pulled back from binary marginal cones. This report quotes (1.1) as the literal source and treats (1.2) as a reconstructed formulation, not as a silent rewrite.

EFRS define an **elementary collapsing** as merging a nonempty set of levels of one variable into one level, and a collapsing as a sequence of elementary collapsings. A final binary collapse is therefore a choice of a nontrivial two-block partition of the levels of each variable. Binary labels are irrelevant. Thus a three-level variable has three such partitions, each of singleton-versus-pair form, and a 3^3 table has $3^3=27$ binary collapses up to binary label swaps.

A four-point counterexample and the border-basis repair

S / solved | AIM 研讨会问题汇编

Let $$ D=\{v_1,\ldots,v_N\}\subseteq\mathbb Q^d $$ be a design of N distinct rational points. Let $$ B=\{x^{\alpha_1},\ldots,x^{\alpha_N}\} $$ be monomials that are linearly independent modulo the design ideal $I(D)$, and suppose B is the set of standard monomials of a zero-dimensional monomial ideal $$ M=\langle m_1,\ldots,m_r\rangle. $$ Because $|B|=N=\dim_{\mathbb Q}\mathbb Q[x]/I(D)$, B is a quotient basis. Interpolate each m_i uniquely in the basis B: $$ m_i\equiv h_i\pmod{I(D)},\qquad h_i\in\operatorname{span}_{\mathbb Q}B, $$ and put $f_i=m_i-h_i\in I(D)$. Must $$ V(f_1,\ldots,f_r)=D? $$

The source writes $D\subseteq\mathbb Q^d$ but the polynomial ring as $\mathbb Q[x_1,\ldots,x_n]$. Evaluation requires the number of coordinate variables to agree with the ambient dimension (or an additional coordinate map), so throughout this report the intended reading is $n=d$.

No counterexample is supplied there.

A precise probabilistic repair and algebraic criteria for interval cell spectra

P / partially_solved | AIM 研讨会问题汇编

“Shmuel Onn spoke about the spectra of hierarchical models. The spectra is defined to be the set of all sets of possible cell entries in for a multiway nonnegative integral table with fixed marginal totals.”

Problem 37. Find the spectra of various models and classes of models.

Question 38. With respect to some distribution is the set of tables whose range of cell entries are intervals dense among all tables?

Under **Shmuel Onn** it says:

The wording of Question 38 does not specify:

1. whether the random objects are tables, margin vectors, or models; 2. a probability law or a sequence of laws; 3. whether “dense” means topologically dense, positive probability, probability one, or asymptotic probability one; 4. whether “range” refers to one distinguished cell or every cell.

Consequently the original sentence is not, by itself, a well-posed yes/no proposition. The mathematical results below first isolate the deterministic property and then give an explicit probabilistic repair.

P / partially_solved | AIM 研讨会问题汇编

Question 62 (Riccomagno). Is there an algebraic method to decide which Est \(\tau\) factor is best when working with perturbed designs?

“A design \(D\) is a finite subset of \(\mathbb R^d\). The design ideal \(I(D)\) is the vanishing ideal of polynomial functions vanishing on \(D\). The set of standard monomials modulo \(I(D)\) given a term order \(\tau\) is denoted \(\mathrm{Est}_\tau\). A linear polynomial model \(L\) is a list of monomials.”

Among the distinct standard-monomial bases \(\mathrm{Est}_\tau\) supplied by term orders, can algebra select one that is best for a perturbed design?

Quantum lower bounds for group-theoretic problems in the generic group model

We would like to solidify the credentials of group-theoretic cryptography as post-quantum by developing lower bounds for the quantum complexity of problems arising in group theory. It would be especially nice to develop such a bound for the vectorisation problem, since this underpins many hardness problems in the area.

Algebraic fibers and sharp sets for missing categorical data

P / partially_solved | AIM 研讨会问题汇编

Question 19. Can algebraic techniques be used to better imputing missing categorical variable?

Inspection of the official PDF places it under Russell Steele, immediately after Question 18 about locating modes in a mixture and immediately before Question 20 about collapsing levels of categorical variables for multiple imputation. The source says:

Two natural repairs are “used to better impute a missing categorical variable” and “used to improve imputation of missing categorical variables.” The adjacent multiple-imputation question favors the second, broader reading, which is used below. The original wording is preserved above.

An imputation problem is not defined until the observation pattern, missingness mechanism, substantive model, and output type are specified. This report treats the smallest nontrivial population model in which those distinctions can all be made exact: a fully observed categorical variable \(X\), a partly observed categorical variable \(Y\), and its response indicator \(R\). The output is usually a set of imputation distributions, not a hard category assignment.

Analysis of Boolean Functions - Uncertainty Principle for Quadratic Fourier Analysis

O / open | AMR 问题清单汇编

Suppose $q_1, \dots, q_m \colon \mathbb{F}_2^n \to \mathbb{F}_2$ are polynomials of degree at most 2 and suppose the indicator function of $(1, \dots, 1) \in \mathbb{F}_2^n$, namely $\operatorname{AND} \colon \mathbb{F}_2^n \to \{-1,1\}$, is expressible as $\operatorname{AND}(x) = \sum_{i=1}^m c_i (-1)^{q_i(x)}$ for some real numbers c_i. What is a lower bound for m?

16655 | AIM-COMPUTATION-0078

Base-encoded monomial-curve designs

P / partially_solved | AIM 研讨会问题汇编

Given finitely many monomials in \(\mathbb R[x_1,\ldots,x_d]\), construct a finite real design on which their evaluation vectors are linearly independent.

The immediately preceding source text defines a design \(D\) as a finite subset of \(\mathbb R^d\), its design ideal \(I(D)\) as the ideal of polynomials vanishing on \(D\), and a linear polynomial model \(L\) as a list of monomials. Thus the mathematical core is:

“Special statistical properties” is not defined in the source. This report therefore treats two precise and standard properties:

1. **saturation and identifiability:** for \(n=|L|\), use exactly \(n\) runs and obtain a nonsingular model matrix; 2. **restricted exact D-optimality:** after restricting candidate points to a specified compact monomial curve, maximize the determinant of the information matrix among all saturated, equal-replication designs on that curve.

The second property is deliberately qualified. No claim of D-optimality among all designs in \(\mathbb R^d\), nor among all approximate designs, is made.

Componentwise entropy rigidity and a reduced search for a non-multilinear matroid

P / partially_solved | AIM 研讨会问题汇编

Conjecture 22. There exists a connected matroid whose CI-structure is p-representable but not multilinear.

Suppose independence vatieties are properly defined, also for the CI constraints involv-ing functional independences, over the field of complex numbers.

Inspection of the official PDF and its HTML transcription shows that this second sentence is not part of Conjecture 22. It is the setup immediately before Conjecture 23. This report therefore treats only the one-sentence Conjecture 22.

The workshop uses František Matúš's augmented CI viewpoint, in which functional dependences are included alongside ordinary conditional independences. This point matters: functional dependence is the equality \(H(X_e\mid X_A)=0\), and is the entropy analogue of \(r(A\cup e)=r(A)\).

16740 | AIM-COMPUTATION-0090

Degree bounds and the dependence on the modulus

P / partially_solved | AIM 研讨会问题汇编

Consider \(\mathbb F_p\) and \(d\in\mathbb Z_{>0}\), and \(S\subset\mathbb F_p\) with \(|S|=d\). Let \(h(X)\in\mathbb F_p[X]\) with \(h(s)\ne0\) for all \(s\in S\). Let \(G\) be the group generated by \(X-s\) for \(s\in S\). In the original AKS paper, we have \(|G|\ge 2^d\). There are techniques for getting \(|G|\ge (5.82)^d\) (using lattice point counting); there seems to be much more room for improvement (perhaps using ABC). Perhaps \[\frac{\log |G|}{d}\longrightarrow\infty \] as \(d\to\infty\), uniformly over \(h\).

The printed question is:

The main sentence does not specify the ambient group. Remark (v) immediately after the question says “Instead of looking at \(\mathbb F_p[X]/(h)\), look at an elliptic curve...”. I therefore use the following reconstruction: \[R_h=\mathbb F_p[X]/(h),\qquad G_h=\langle \bar X-s:s\in S\rangle\le R_h^\times . \] The condition \(h(s)\ne0\) is precisely what makes each \(\bar X-s\) a unit: \(\gcd(h,X-s)=1\).

There is a second, consequential omission: the displayed question imposes no degree condition on \(h\). Such a condition is indispensable for the quoted \(2^d\) lower bound. Accordingly, this report distinguishes:

1. the **literal quotient-ring reading**, with arbitrary nonconstant \(h\) satisfying the printed condition; and 2. the **intended AKS reading**, in which \(h\) has additional degree and cyclotomic/Frobenius structure that the question does not state.

The first reading admits an elementary counterexample to the proposed uniform limit. The second remains a meaningful harder question, and this report does not claim to settle it.

Frantisek Matus Frantisek Matus spoke about the representability of conditional independence (CI) structures.

Direct inspection of the official PDF and its neighboring text shows the following layout:

Those two lines are the heading and introduction of the next speaker section. They are preserved in the exact input record but are not part of Question 20. Questions 17--20 follow the preceding Russell Steele section; Conjecture 21 begins the Frantisek Matus section.

The source does not define “quality,” which variable is missing, or which inferential target must survive. A universal answer is impossible without those choices. This report therefore proves a scoped result:

- \(X\) is a fully observed fine categorical covariate; - \(Z=g(X)\) is a proposed collapse of its levels; - \(W\) is a fully observed finite covariate vector; - \(Y\) is a categorical outcome with missingness indicator \(R\); - the inferential target is the conditional law \(P(Y\mid Z,W)\), and hence any estimand depending only on the joint law of \((Y,Z,W)\); - “imputation quality” means correct asymptotic centering of that target law under a saturated imputation model, while interval validity additionally requires proper and congenial multiple imputation.

This scope directly isolates what is gained and what can be destroyed by collapsing before imputation.

Exact cumulant ideal of the normalized binary four-cycle

S / solved | AIM 研讨会问题汇编

Question 15. What is the cumulant ideal of the binary four-cycle model?

The recovered question is:

In the source PDF they begin the next speaker's topic. Immediately before Question 15, Henry Wynn's section asks for polynomial descriptions obtained by passing from probabilities through moments to cumulants.

I interpret “four-cycle model” as the undirected binary graphical model on

\[C_4:\qquad E=\{12,23,34,14\}. \]

Its global Markov statements are

\[X_1\mathbin{\perp\!\!\!\perp}X_3\mid(X_2,X_4), \qquad X_2\mathbin{\perp\!\!\!\perp}X_4\mid(X_1,X_3). \]

This matters because “binary four-cycle” can also refer to models for marginal independence. Pistone and Wynn's four-cycle example uses the isomorphic relabeling whose nonedges are \(12\) and \(34\), and uses \(\{-1,1\}\) coding. The answer below instead fixes the standard edge labeling above and initially uses \(\{0,1\}\) coding. The two labelings are related by a permutation, and affine binary recoding gives an equivalent cumulant ideal.

Question 10. Are there always only 0, 1, or 2 statistically interesting solutions to the blocking probability equations in network tomography?

The heading **Ruriko Yoshida** immediately after Question 10 begins the next speaker's topic.

The terminology is made precise by the direct follow-up technical report of Dinwoodie, Gamundi, and Mosteig [DGM04]. Its model is a complete circuit-switched network with dynamic routing: traffic first attempts the direct edge and, if that edge is blocked, may try a two-edge route. An edge variable \(b_{ij}\) is its blocking probability. In the large-capacity Erlang approximation, the fixed-point equations become polynomial after one restricts to positive blocking probabilities. The report calls a real solution statistically/probabilistically interesting precisely when every blocking coordinate is in the open interval \((0,1)\).

This is therefore a dynamic-routing loss-network question, not the unrelated multicast maximum-likelihood model also called “network tomography.”

Source-recovery audit: [DGM04] was recovered from the Internet Archive capture `20060907132830` of its original SAMSI URL. The recovered PDF is 864,647 bytes, has SHA-256 `c2627b2bc2478d90d5a974272f44f54a44d913373b02a0f59ad6fde7143ae150`, and the CDX digest is `UQVCBNMKOPN554HBLYPVOCBKPPJDNMKI`. These details make the equation reconstruction independently checkable.

16780 | AIM-CRYPTOGRAPHY-0019

Exact period-quotient reduction and unary lift cost for hidden shift on Z^d

P / partially_solved | AIM 研讨会问题汇编

Hidden shift on \(\mathbb Z^d\) where \(f_0\) and \(f_1\) are periodic under unary oracle cost.

This is problem 4.5 in the “Hidden Shift” section of the 2019 AIM workshop *Quantum algorithms for analysis of public-key crypto*. The official workshop summary attributes the sentence to Greg Kuperberg and reproduces it verbatim [AIM19]. The adjacent problem asks for hidden shift on \(\mathbb Z\) with a bounded shift “under binary cost of oracle.” That juxtaposition suggests that “unary” may charge in proportion to coordinate magnitude rather than its bit length, but neither the workshop summary nor the workshop page defines the phrase.

Several mathematically inequivalent readings are therefore present in the one-line source:

1. “Periodic” may mean only that there is one nonzero period, that the full period group has rank \(d\), or that a full-rank period lattice and basis are supplied. 2. The requested answer may be an exact vector \(s\in\mathbb Z^d\), a chosen representative, or the identifiable residue class of \(s\) modulo all periods. 3. Standard hidden shift assumes injective quotient functions. Arbitrary periodic functions need not be injective even after quotienting by their full translation stabilizer. 4. “Unary cost” may mean unary address encoding, cost proportional to the largest address in a coherent query, average branch cost, or merely unit cost for each oracle invocation.

The precise reconstruction used below is \[f_0,f_1:\mathbb Z^d\longrightarrow Y, \qquad f_1(x)=f_0(x+s), \] with exact, coherently queryable oracles. The full period or translation-stabilizer lattice is \[P=\operatorname{Stab}(f_0) :=\{p\in\mathbb Z^d:f_0(x+p)=f_0(x)\text{ for every }x\in\mathbb Z^d\}. \] The primary recovery target is \([s]\in\mathbb Z^d/P\), since Section 5 proves that this is exactly the information determined by the two functions. Exact \(s\) is not identifiable without a convention or an extra promise.

16804 | AIM-COMPUTATION-0041

Finite Markov templates with several varying level sets

P / partially_solved | AIM 研讨会问题汇编

What types of "finiteness" statements can be made about Markov bases for hierarchical models as more than one set of levels is allowed to vary?

The source places this question immediately after the note that Seth Sullivant spoke about Markov bases for hierarchical models and the structure of minimal Markov-basis elements, and immediately before the problem asking which binary hierarchical models have moves of degree at most four. Thus, “sets of levels” is interpreted here as the state sets of two or more factors of a contingency table. That interpretation is consistent with the later terminology in Hoşten--Sullivant, but it is a reconstruction: the one-sentence question does not specify a category of embeddings or a precise finiteness invariant.

The question is broad rather than a single yes/no conjecture. The results below separate several inequivalent notions, prove an elementary equivalence that is useful for the standard level-permutation system, give a positive two-growing-axis family with a boundary-safe connectivity proof, and contrast it with the known negative three-way universality theorem.

16810 | AIM-INFRASTRUCTURE-0090

Fixed-ambient extraction of roots of finite Frobenius modules

P / partially_solved | AIM 研讨会问题汇编

If R is a regular ring of characteristic p, then the local cohomology modules have many nice finiteness properties; one can describe many of these properties via the theory of unit F-modules. Work on implementing these calculations in M2 was begun at the 2023 Minneapolis workshop.

Given an F-finite F-module, how can one efficiently compute a unit F-module? For example, given the map $\operatorname{Ext}^i(R/I,R)\to \operatorname{Ext}^i(R/I^{[p]},R)$, how can one find a root for the local cohomology module $H^i_I(R)$?

Starting from a finite generating morphism $\beta:M\to F^*M$, compute an injective finite generating morphism (a root) for the same unit F-module.

Flip Graph Connectivity in 3D

O / open | AMR 问题清单汇编

Is the flip graph connected for general-position points in $\mathbb{R}^3$? Given a set of n points in $\mathbb{R}^3$, the flip graph has a node for each tetrahedralization of the set. Two nodes are connected by an arc if there is a 2-to-3 or 3-to-2 ``bistellar flip'' of tetrahedra between the two simplicial complexes. In the plane, the flips correspond to convex quadrilateral diagonal switches; in $\mathbb{R}^3$, a $5$-vertex convex polyhedron is ``flipped'' between two of its tetrahedralizations.

Four distinct reductions in the American min-put benchmark

P / partially_solved | AIM 研讨会问题汇编

Recovered statement. Analyze the independent, identically distributed \(d\)-asset Black-Scholes American min-put benchmark (1), and distinguish exact and approximate ways in which its computational or state dimension can be reduced. In particular, identify what can be reduced without changing the benchmark and what information an exact stopping rule still needs.

It begins with a table-of-contents fragment and then reproduces almost all of “Chapter A: Open problems” from the AIM workshop list *Numerical probabilistic methods for high-dimensional problems in finance* [1]. It includes:

- A.1 on optimal stopping, HJB equations, and reflected forward-backward SDEs; - A.2 on Longstaff-Schwartz regression, Malliavin methods, quantization, dual methods, cubature, and coupled FBSDEs; - A.3, a numerical benchmark; - A.4, several meanings of dimension reduction; and - A.5, the chapter bibliography.

The official eight-page AIM PDF was also inspected directly.

We recover \[S_t^i=100\exp\!\left((r-\tfrac12\sigma^2)t-\sigma W_t^i\right), \qquad g(x)=\left(K-\min_{1\leq i\leq d}x_i\right)_+,\quad K=100. It is immaterial in law because \(-W\) is again a standard Brownian motion. “Uncorrelated” components of the stated standard Brownian motion are independent.

The recovered research task is:

Section A.4 proposes PCA, low-factor economic models, and maturity randomization. This report develops a precise audit: PCA and low-rank linear factors do not exactly reduce this isotropic benchmark; permutation symmetry removes duplicated labeling but not continuous dimension; the European terminal subproblem has an exact one-dimensional integral; and that integral proves that the present minimum alone is not an exact reduced state.

This is mathematical benchmark analysis, not option-pricing advice or a trading recommendation.

Parameter determination for post-quantum hash functions

Ramón Flores presented a Tillich-Zémor-style hash function using the Cayley graph of special linear groups in arbitrary dimension. Questions remain, however, about the optimal choice of parameters for use with this protocol.

In the design of the hash function one has control over two parameters; the dimension of the special linear group considered, and the characteristic of the underlying field. We would like to determine appropriate choices for both via two branches of cryptanalysis: first, by analysis of the multivariate system implied by long matrix products; and second by direct analysis of group-theoretic properties. We should also study the impact of the partial homomorphicity exhibited by the scheme.

Prox-Regularity of Polynomial Stability Abscissas

O / open | Oberwolfach 报告问题汇编

In the space of monic degree-k polynomials $p(s) = s^k + a_{k-1} s^{k-1} + \cdots + a_0$, let $\alpha(p) = \max\{\operatorname{Re} \lambda : p(\lambda) = 0\}$ be the spectral stability abscissa, and say that p is Hurwitz stable if $\alpha(p) \leq 0$. Does every degree-k polynomial $p(s)$ sufficiently close to s^k have a unique nearest Hurwitz stable polynomial? Equivalently, is the stability abscissa α prox-regular at s^k?

Regular-orbit equivalence and affine orbit-size certificates for SDLP

P / partially_solved | AIM 研讨会问题汇编

It asks for progress on four related questions:

1. quantum equivalence of the semidirect discrete logarithm problem (SDLP) and the corresponding computational Diffie--Hellman problem (SCDH); 2. quantum composition-series methods beyond solvable groups; 3. a “Sylow theory” for projected sets arising from the semidirect-product structure; and 4. a classical method to compute the size of the acting object in the semigroup variant of SDLP.

The record does not define “projected sets,” “acting group,” an oracle model, or the success notion for SCDH. Its literature field is empty.

There is also a convention issue. We use the **forward-product convention**

$$ s_0=1,\qquad s_n=g\,\varphi(g)\cdots\varphi^{n-1}(g), $$

for a finite monoid M, an endomorphism $\varphi:M\to M$, and $g\in M$. Some recent papers use the reverse product. The two conventions must not be mixed inside a reduction.

Simultaneously certified invariant quartet scoring and robust assembly

P / partially_solved | AIM 研讨会问题汇编

Problem 35. Develop techniques to use invariants in combination with quartet methods.

It occurs in Elizabeth Allman's block immediately after problems on secant varieties, flattening invariants, the stochastic image, “good” invariants, tree/model fit, and among-site rate variation, and immediately before a question about identifying clades. Thus the intended program is to turn local algebraic conditions-especially rank conditions on quartet flattenings-into a scalable full-tree reconstruction method.

Three logically separate tasks are implicit:

1. **Population identifiability:** at the exact site-pattern distribution, does the invariant distinguish the true quartet? 2. **Finite-sample quartet scoring:** from \(N\) sites, how should the three quartet topologies be scored, normalized, tied, or rejected? 3. **Global assembly:** how should possibly dependent, weighted, missing, or conflicting quartet decisions be combined into one tree?

Solving one layer does not solve the other two.

The Number of Pointed Pseudotriangulations

O / open | AMR 问题清单汇编

For a planar point set S, is the number of pointed pseudotriangulations always at least the number of triangulations? A pseudotriangle is a planar polygon with exactly three convex vertices. Each pair of convex vertices is connected by a reflex chain, which may be just one segment. (Thus, a triangle is a pseudotriangle.) A pseudotriangulation of a set S of n points in the plane is a partition of the convex hull of S into pseudotriangles using S as a vertex set. A minimum pseudotriangulation, or pointed pseudotriangulation, has the fewest possible number of edges for a given set S of points. See for examples, explanation of the term ``pointed,'' and further details.

Transcendence-aware algebraic localization of symmetric Gaussian-mixture modes

P / partially_solved | AIM 研讨会问题汇编

Question 18. Can algebra be used to better approximate the location of the modes in a mixture?

The exact AIM question is:

The preceding sentence says that Steele spoke about mixture models, model selection, and the Bayesian Information Criterion. Questions 16 and 17 concern integration and BIC for mixture models; Question 18 contains no additional assumptions. In particular, the source does not say:

- whether a “mode” is a mode of a fitted density, posterior, or likelihood; - which component family is used; - whether component parameters are known or estimated; - the number of components or ambient dimension; or - whether “better” refers to coordinate error, objective-value error, or computational cost.

This report studies the standard fixed-parameter density-mode interpretation for Gaussian mixtures. This is a reconstruction, not extra text from the source. It is also deliberately narrower than the source: arbitrary component densities do not admit one universal algebraic treatment.

Unique minimal Markov bases, bipartite cycles, and padding monotonicity

P / partially_solved | AIM 研讨会问题汇编

Do \(I\times J\times K\) tables under the no 3-way interaction model always have a unique minimal Markov basis?

The source continues with two related questions: Bernd Sturmfels asks about three-way tables with structural zeros coming from a very regular design, and Henry Wynn asks whether the group structure of circuits plays a role.

After Wynn's sentence, “Emily Gamundi” is set in the larger speaker-heading font; Question 10 then follows under that heading.

The intended statistical model is the hierarchical model with generating class \[[IJ][IK][JK], \] also called the no-three-factor-interaction model. Conditional inference fixes all three two-dimensional margins \(x_{ij+},x_{i+k},x_{+jk}\). This is not the complete-independence model \([I][J][K]\), which fixes only one-dimensional margins and has different Markov-basis behavior.

Random point processes corresponding to β-ensembles, or, equivalently, log gases at inverse temperature β, are defined for arbitrary $\beta>0$. The orthogonal, unitary, and symplectic ensembles corresponding to $\beta=1, 2,$ or 4, respectively, are now, of course, well understood, but other values of β are also believed to be relevant in applications, for example, in the statistical description of headway in freeway traffic. For certain rational values of β, β-ensembles are related to Jack polynomials, but for general β much less is known. The analysis of β-ensembles for general β represents an interesting, and increasingly important, challenge. Recently there have been significant developments in the theory of general β-ensembles. As a result of the work of Edelman and Dumitriu, and also others, we now know that for all $\beta>0$, there exist (tridiagonal) random matrix models whose eigenvalues are distributed according to β-ensembles. Furthermore, taking an appropriate scaling limit of these tridiagonal matrix ensembles, one arrives at the following remarkable fact. Let $B(x)$, $x\geq0$, denote Brownian motion, and for any $\beta>0$, let H_β denote the Schr\"odinger operator $\frac{d^2}{dx^2}-x-\frac{2}{\sqrt \beta} dB(x)$ acting on $L^2((0,\infty),dx)$ with Dirichlet boundary conditions at $x=0$. Then (Edelman-Sutton, Ramirez-Rider-Virag) for almost all realizations $B(x)$, $x\geq0$, H_β is self-adjoint with discrete spectrum $\lambda_1(B,\beta)>\lambda_2(B,\beta)>\cdots$ and for each k, $\lambda_k(B,\beta)$ has precisely the same distribution as the kth largest eigenvalues of the corresponding β-ensemble in the standard edge scaling limit. Part of the challenge in analyzing general β-ensembles is to use H_β to obtain information about these ensembles. Already the variational characterization of the λ_k's has been used to give simple proofs of bounds on the asymptotics of the distributions of the λ_k's. Question: can one derive the Tracy-Widom formula for $\lambda_1(B;\beta=2)$, say, directly from H_β? At a more conceptual level, the (β-ensemble $\leftrightarrow H_\beta$) correspondence brings random matrix theory front and center into the arena and practice of modern day probability theory.

A feasibility sieve for negative-energy binary-single direct scattering

P / partially_solved | AIM 研讨会问题汇编

Problem 28. Consider negative energy three-body orbits which are unbound in both directions of time. The two Jacobi vectors of such an orbit then asymptote to Keplerian orbits in both the distant past and the distant future, and so associated to such an orbit we have pair of Kepler elements in the past (one elliptic the other hyperbolic) and another pair in the future. The “direct scattering” problem is: which pair of Kepler elements can be connected to each other in this way? (Richard Montgomery)

A Jacobi-Maupertuis and McGehee scale-shape dictionary

P / partially_solved | AIM 研讨会问题汇编

Problem 22. Assume $E=0$ and angular momentum $=0$. Can Jacobi's metric give new insights beyond what McGehee's coordinates give? (Richard Montgomery)

The statement does not specify the number of bodies, the ambient dimension, or the collision regime. The immediately preceding problems discuss three-body syzygies, shape space, and one four-body volume question, while McGehee's original work and most later comparisons concern Newtonian three-body dynamics near triple collision or parabolic infinity. The principal reading adopted here is therefore the Newtonian planar three-body problem after translation and rotation reduction. The scale-shape calculation is first given for an arbitrary translation-reduced Newtonian N-body configuration, so the assumption is not hidden.

A quantified Gibbons-Hawking N-body cluster model

P / partially_solved | AIM 研讨会问题汇编

2. (Mazzeo) Combine asymptotics with N -body techniques.

2. (Mazzeo) Combine asymptotics with N-body techniques.

- “Wrap-up Session, March 21 2004. R. Mazzeo as moderator.” - “Question (T. Hausel)” and the motto that toric hyperkähler quotients are perhaps the simplest complete hyperkähler metrics. - “Problem: Understand the Hodge cohomology of these spaces from a systematic point of view.” - “Possible first steps:” followed by three numbered items.

Printed item 1 asks for the asymptotics of these spaces and cites Bielawski--Dancer and Gibbons--Rychenkova. Printed item 2 is exactly:

Printed item 3 begins Hausel's discussion of middle-dimensional \(L^2\) Hodge cohomology, self-duality, the \(L^2\)-signature, combinatorics, matroids, and an index theorem. The PDF prints “N-body” without spaces.

The prompt is a research direction rather than a proposition with quantifiers. This report gives it a precise, limited realization for the rank-one toric hyperkähler subclass of multi-center Gibbons--Hawking metrics. It does not duplicate item 1's general asymptotic question and does not claim the Hodge theorem requested by item 3.

A Tracy-Widom Central Limit Theorem

O / open | AMR 问题清单汇编

The fact that RMT, and the Tracy-Widom distributions, arise in so many problems in so many different areas leads one to the following question: how can one characterize RMT in purely probabilistic terms? For example, we know that if we take i.i.d.'s $(a_1,a_2,...)$, add them up, and then center and scale appropriately, $$ (a_1,a_2,...)\to(S_1,S_2,...),\qquad S_n=\frac{\sum_{i=1}^n a_i-n\mu}{\sqrt n}, $$ then as $n\to\infty$, S_n converges in distribution to a Gaussian random variable: this is the famous Central Limit Theorem. The analogous situation for RMT is the following: take i.i.d.'s $(a_1,a_2,...)$, perform an operation X on them, $$ (a_1,a_2,...)\to(X_1,X_2,...), $$ and as $n\to\infty$ the X_n's converge to the Gaudin distribution, or the Tracy-Widom distribution. The question is, ``What is X?'' Important progress towards answering this question has been made recently, and independently, by Baik-Suidan and Bodineau-Martin, but the full problem remains open and very challenging.

A two-vertex counterexample to color-number monotonicity

S / solved | AIM 研讨会问题汇编

(5) Let \(G\) be a finite graph with maximum degree \(\Delta\). This problem is about choosing a random coloring from the uniform distribution. Work with Glauber dynamics: pick a site at random, choose a color at random, and try to change the color at the chosen site. If this results in a proper coloring, make the change. If not, keep the current coloring. For \(q\geq \Delta+2\) it is known that this Markov chain is ergodic, i.e., that it connects the set of proper colorings. Let \(t=t(q)\) be the mixing time: the smallest time such that the total variation distance from the uniform distribution is at most \(1/e\) from any starting configuration. The question is: does \(t(q)\) decrease as \(q\) increases? Even on the square lattice with \(n\) sites there are curious gaps in our knowledge: we know that \(t(3)\) is polynomial in \(n\) (Luby, Randall and Sinclair: Proc. FOCS 1995) and we know that \(t(q)=O(n\log n)\) for \(q\geq6\). But, for \(q=4\) and \(q=5\) we do not even have a polynomial upper bound, even though there is overwhelming numerical evidence that there is a finite correlation length, and therefore that the mixing time is \(O(n\log n)\).

17120 | AMR-080-0007

additional problems for integrable systems

O / open | AMR 问题清单汇编

In 2002, P. Zhou analyzed the behavior of solutions of the Cauchy problem for perturbations of the defocusing NLS equation i u_t + u_{xx}- 2|u|^2 u - \epsilon |u|^\ell u =0, u(x,t=0) = f(x) \to 0 \qquad as\quad |x|\to \infty. An open problem of great and basic interest is to analyze solutions of the Cauchy problem for perturbations of the focusing NLS equation i\tilde{u}_t+ \tilde{u}_{xx} +2|\tilde{u}|^2 u +\epsilon |\tilde{u}|^{\ell} \tilde{u} =0, \tilde{u}(x,t=0) = \tilde{f}(x) \to 0\qquad as\quad |x|\to \infty. The principal new difficulty in analyzing (eq14) over (eq13), is that for solutions $u(x,t)$ of (eq13) we have decay in the sup norm \sup_x |u(x,t) | \le c/t^{1/2} \to 0 \qquad as\quad t\to\infty. There are two open problems here. The first is to use Riemann--Hilbert/steepest-descent methods to prove the results in Venakides et al.\ rigorously. The second problem concerns the fact that if we replace the exponential forces e^x by a general force $F(x)$, \ddx_k =F(x_{k-1}- x_k) - F(x_k - x_{k+1}), \qquad k\ge 1 then numerical simulations show that the solution of the shock problem for this system behaves in the same way as $t\to\infty$ as the Toda system, provided (eq16) has a 2-periodic solution x_k (t+T) = x_k(t), \quad T>0, \qqquad x_{k+2}(t) = x_k(t) for $k\in \mathbb{Z}$. Second open problem: Analyze the general shock problem (eq16) for suitably small perturbations $F(x)$ of e^x. One would like, rather, a definition which is intrinsic to probability

Audible primitive two-torus areas on a flat three-torus

P / partially_solved | AIM 研讨会问题汇编

On a Riemannian three-manifold, is there a natural class of two-dimensional geometric objects whose data are related to the scalar Laplace spectrum analogously to the relation between closed-geodesic lengths and wave-trace singularities?

1. When \(M\) is a 3-manifold are there some 2-dimensional objects that are related to \(\operatorname{Spec}(\Delta)\) in a similar way?

“Closed totally geodesic surfaces are not the correct 2-dimensional objects to consider for #1, since there are too few of them.”

This attempt owns only the first:

The intended question is therefore:

The PDF boundary is unambiguous. Item 1 ends at “way?” Item 2, asking for an “area spectrum” of minimal surfaces, and item 3, asking to count minimal surfaces in \(T^4=T^2\times T^2\), are separate numbered questions and are excluded. The later “Questions (M.

The one source remark explicitly attached to item 1 is Mazzeo's:

The remarks about physical intuition, a Selberg trace formula, and the eta invariant follow the three-question cluster but do not explicitly identify item 1. The Selberg comment is relevant background to the preceding wave-trace discussion, but it is not treated here as a claim that surfaces replace geodesics.

The mathematical analysis below uses that standard convention rather than silently relying on the damaged display.

17164 | AIM-PHYSICS-0044

Coercivity, collision support, and the identity braid for the class (1,0,-1)

P / partially_solved | AIM 研讨会问题汇编

Is \((1,0,-1)\) realized by a collision-free periodic orbit (see figure 3)? If exists, is it minimizing or not? Is trivial braid realized by a collision-free periodic solution? (Andrea Venturelli)

\[k_{ij}=\operatorname{Deg}(x_i-x_j,0), \]

the number of oriented turns of the side vector \(x_i-x_j\). Problem 4 fixes the displayed coordinate order as \((k_{12},k_{23},k_{31})\). The exact Problem 7 is:

Thus the first clause means

\[k_{12}=1,\qquad k_{23}=0,\qquad k_{31}=-1. \tag{1} \]

There is no sign reversal hidden in the last coordinate: multiplication of a loop in \(\mathbb C\setminus\{0\}\) by \(-1\) is a fixed rotation and does not change degree, so \(k_{31}=k_{13}\).

Figure 3 is on the following page and is captioned exactly “A possible solution with homology class \((1,0,-1)\).” Inspection of the original vector figure shows a schematic collection of directed tracks. The PDF supplies no masses, period, initial conditions, residual, computer-assisted enclosure, or symmetry group for it. Consequently the drawing is evidence for the intended topology, not a proof or reproducible numerical orbit. The bullet below the figure about a systematic numerical search belongs to Problem 8, not Problem 7.

The source does not specify masses or a braid quotient. Below, the analytic statements use arbitrary fixed positive masses and fixed period. “Full trivial pure braid” means the identity in the labeled inertial configuration space. Reduced/projective conventions are discussed separately.

17206 | AIM-PHYSICS-0003

Exact zero-Kerr spectrum and high-energy Kerr localization

P / partially_solved | AIM 研讨会问题汇编

The canonical AIMPL record asks for the eigenvalue distribution of \[H=\omega a^\dagger a+\chi(a^\dagger a)^2-i\gamma aa^\dagger +\beta(a^\dagger+a), \qquad \omega,\chi,\gamma,\beta\in\mathbb R. \] With the standard bosonic commutation relation \([a,a^\dagger]=I\) and number operator \(N=a^\dagger a\), one has \[aa^\dagger=N+1. \] Therefore the exact canonical operator is \[\boxed{H=\chi N^2+(\omega-i\gamma)N-i\gamma I+\beta(a+a^\dagger).} \]

There is a source-convention discrepancy worth recording. The two operators differ by the scalar \(-i\gamma I\). Thus their spectra have exactly the same shape and multiplicities, shifted vertically by \(-i\gamma\).

The natural setting is the one-mode bosonic Fock space \(\mathcal F=\ell^2(\mathbb N_0)\), with orthonormal number states \(e_n\) and \[ae_n=\sqrt n\,e_{n-1},\qquad a^\dagger e_n=\sqrt{n+1}\,e_{n+1},\qquad Ne_n=ne_n. \] The prompt does not state a domain. For \(\chi\ne0\), the closed realization used below has domain \(\mathcal D(N^2)\). For \(\chi=0\) but \(\alpha:=\omega-i\gamma\ne0\), it has domain \(\mathcal D(N)\). The degenerate case \(\chi=\alpha=0\) is treated separately.

Physically, \(\chi N^2\) is a Kerr nonlinearity up to a linear frequency renormalization, \(\beta(a+a^\dagger)\) is a coherent one-photon drive, and \(-i\gamma N\) is the loss term in an effective no-jump Hamiltonian (up to normalization of \(\gamma\)). The full open-system dynamics is governed by a Lindblad generator, whose spectrum is not the spectrum asked for here.

Fixed winding numbers: exact pair bounds, graph coercivity, and collision loss

P / partially_solved | AIM 研讨会问题汇编

Poincare characterizes a homology class in the planar three-body problem by three integers \(k_{ij}=\operatorname{Deg}(x_i-x_j,0)\); that is, the number of oriented turns of the side \(x_i-x_j\).

Problem 4 (due to Poincare, 1896). Can we obtain periodic solutions by minimizing while fixing the \(k_{ij}\)'s? (Alain Chenciner)

The printed text reads “Poincare characterize homology class ...”; in normalized English, its mathematical content is:

The problem is then:

The source remarks are:

- answers are known when all \(k_{ij}\) are nonzero; - for \((k_{12},k_{23},k_{31})=(1,1,1)\) or \((-1,-1,-1)\), minimizers are Lagrange equilateral solutions, while the other all-nonzero cases have collisions; - in choreographies the three \(k_{ij}\)'s are equal; - Montgomery asks whether the answer is the same in the restricted problem.

The PDF does **not** specify whether the loops are labeled, whether translations and rotations have been reduced, which period is fixed, or what precise restricted problem and frame are intended. Since \(x_i-x_j\) uses labeled positions, the natural reading is the labeled collision-free configuration space. Fixed-period minimization and center-of-mass reduction are necessary analytic normalizations and are made explicit below. Choreography is an additional symmetry constraint, not part of the bare homology constraint. The phrase “restricted case” remains ambiguous; the massless limit is analyzed in Section 9 without pretending that this resolves every possible restricted formulation.

17255 | AIM-PHYSICS-0042

Homology-only escape and a strict zero-winding choreography gap

P / partially_solved | AIM 研讨会问题汇编

Problem 5. Is the figure-8 orbit a minimizer with homology class \((0,0,0)\)? (Alain Chenciner)

One can ask, for example, if the Eight is a minimizing choreography in its homology class \((0,0,0)\) (each side of the triangle has zero total rotation).

The source-verified AIM item is exactly:

The preceding text is essential. Immediately before Problem 4, the PDF says that Poincaré describes a homology class in the planar three-body problem by \[k_{ij}=\operatorname{Deg}(x_i-x_j,0), \] the oriented number of turns made by the side \(x_i-x_j\). Problem 4 asks whether one can obtain periodic solutions by minimizing with the \(k_{ij}\) fixed. Its remarks say that the answer is understood when all three integers are nonzero, that the classes \((1,1,1)\) and \((-1,-1,-1)\) give the Lagrange equilateral solutions, and that in choreographies all three integers are equal. Problem 5 then follows as a separate one-line item.

The one-line AIM version does **not** state whether minimization is among all loops, all choreographies, a fixed symmetry space, a fixed braid class, or periodic solutions only. Nor does it state a period, centre-of-mass condition, or size normalization. These omissions cannot be silently filled.

There is, however, strong source evidence for the intended reading. In the contemporary ICM article from which the question arose, Chenciner writes:

He introduces this as a problem with **mixed constraints: symmetry and homology or homotopy**. Thus this report distinguishes:

1. the **literal homology-only reading** of the AIM sentence; and 2. the **intended mixed reading**, namely fixed-period, centred simple choreographies with common winding number zero.

It is not Gerver's four-body super-eight from AIM Problem 3.

initial boundary value problems for integrable systems (IBVP)

P / partially_solved | AMR 问题清单汇编

Initial boundary value problems for integrable systems in $1+1$ dimensions are of great interest. It turns out, however, that in Fokas' approach the general initial value problem is overdetermined. In certain ``integrable'' cases (see below) $u_x(0,t)$ can be determined a priori, but this is not the case in general. As demonstrated by Fokas, his approach leads to a Riemann--Hilbert reformulation of the IBVP, but one can only apply the powerful non-linear steepest descent method to determine the asymptotic behavior of $u(x,t)$ as $t\to \infty$ in the case that $u_x(0,t)$ is known a priori. A particular stand out open problem is to compute the long-time behavior of the solution $u(x,t)$ of the focusing NLS equation, $i u_t= u_{xx} + 2|u|^2 u$, with $u(x,0)=f(x)$, $x\ge 0$, given and $u(0,t) = e^{iwt}$, $t\ge 0$ with $w\in \mathbb{R}$. In other words, the effect of the oscillatory component of the driver does not propagate into the lattice and away from the boundary at $k=0$.; If $\ga_1 > \gamma> \ga_2$, then the asymptotic motion is described by a travelling wave x_k(t) = c_1 k + Y_1 (\beta_1 k + \gamma t), \qquad 1 \ll k \ll t transporting energy away from the driver. Here c_1 and β_1 are certain determined constants and $Y_1(1)$ is 2π-periodic 1-gap solution of the periodic Toda lattice.; More generally, if $\ga_j > \gamma > \ga_{j+1}$, a multi-phase wave emerges of the form x_k = c_j k + Y_j (\beta_1 k + \gamma t, \beta_2 k + \gamma t, \dots, \beta_j k + \gamma t), \qquad 1 \ll k \ll t again transporting energy away from the driver, for certain constants $c_j, \beta_1, \dots, \beta_j$. This is an open problem of the first order, illustrating how the natural modes of an extended physical system (k-gap solutions in the case of NLS) can be excited by driving the system externally at one end. This problem arises, in particular, in analyzing the Gross--Pitaevskii equation with a delta function external potential at $x=0$ and even initial data. It turns out that the NLS equation with Robin boundary conditions is an example of an integrable system which is not overdetermined from the point of view of Fokas' method, and indeed for this problem the method can be used to obtain a well-defined and effective Riemann--Hilbert representation for the solution $u(x,t)$ of the IBVP (see). The method of Bikbaev and Tarasov is a non-linear version of the method of images in linear theory, where the solution in $x>0$ is extended to $x<0$, not by reflection as in the linear case, but by a suitable B\"acklund transformation. It is an interesting open problem to use the Bikbaev--Tarasov method to solve the IBVP for defocusing NLS, $iu_t=u_{xx}-2|u|^2 u$, with Robin boundary conditions at $x=0$. In this case the B\"acklund transformation extending the solution from $x>0$ to $x<0$ introduces certain singularities which must be controlled and the long-time behavior of the solution of the IBVP will be very different from the case of focusing NLS. Another open problem, which has broad implications, concerns the smoothness of the solutions $u(x,t)$ of the IBVP for NLS. However in the case of focusing NLS with smooth $f(x)=u(x,0)$ and Robin boundary...

Initial Data for Physical Late-Time Schwarzschild Wave Tails

O / open | Oberwolfach 报告问题汇编

For solutions of the scalar wave equation $\Box_g\phi=0$ on a Schwarzschild background arising from physically realistic isolated-system data, how should one choose or characterize the data on an asymptotically hyperboloidal hypersurface Σ so as to obtain physically meaningful predictions for the late-time asymptotics along future null infinity $\mathcal{I}^+$?

Initial/boundary value problems for integrable systems

P / partially_solved | AMR 问题清单汇编

In the late 1990s Fokas introduced a new, more flexible approach to inverse scattering theory, and in recent years a number of researchers (Fokas, Its,..., Anne Boutet de Monvel, Shepelsky,...) have applied Fokas' approach to the initial/boundary value problem for various integrable systems such as NLS. Much progress has been made, but there is a basic, and puzzling, obstacle to applying the method, viz. one needs to know certain dependent data in order to proceed. For example, the initial/boundary value problem for NLS is well-posed if one gives the initial data $u(x,0)=u_0(x)$, $x\geq 0$, and the boundary data $u(0,t)=u_1(t)$, $t\geq 0$. However, in implementing the method it turns out that one needs to know the dependent data $u_x(0,t)$, $t\geq 0$, as such information appears explicitly in the solution formulae. Progress has been made in determining $u_x(0,t)$, $t\geq0$, from $u_0(x)$ and $u_1(t)$ intrinsically via the method, but the control one obtains on $u_x(0,t)$ is not sufficient in order to obtain the long-time behavior of the initial/boundary value problem. This is true even in simple cases, such as the following: suppose $u(x,t)$ solves NLS in $(x\geq0,t\geq0)$ with $u(0,t)=\sin(\omega t)$, $\omega\neq0$, and $u(x,0)=u_0(x)$, where u_0 is smooth with compact support. How does $u(x,t)$ behave as $t\to\infty$? The solution of this problem for any such $u_0(x)$ would be a very significant development in the theory, and would also be of considerable interest in science and engineering. There is a philosophical point at stake here. The evolution of NLS in $x>0$ represents the interplay of forces which are ``integrable'' at some fundamental, algebraic level, and indeed, if no other forces are present, as in the full-line scattering or periodic cases, the equation can be integrated explicitly. When one considers the initial/boundary value problem, however, new physical forces come into play which describe the interaction of the particles on the boundary with the NLS particles in the interior. There is absolutely no a priori guarantee that the enlarged system, ``NLS particles in $x>0$''+``particles on the boundary'', is integrable. It may be that the long-time behavior of the composite system can only be solved for ``generic, Cantor-set'' like data, as is familiar from KAM theory. In other words, an explicit description of the long-time behavior of the solution of the initial/boundary value problem for NLS for general initial data may not be possible. This is a very intriguing situation.

interacting particle systems and KPZ

P / partially_solved | AMR 问题清单汇编

In 1999, J. All these early examples were ``integrable'' in the sense that certain powerful algebraic tools, e.g., determinantal particle systems, the Robinson--Schensted--Knuth correspondence, Fredholm operator theory, $\dots$, could be applied to reduce the problems at hand to analytically viable forms from which their asymptotic behavior could be deduced using standard asymptotic methods such as the Laplace method/stationary phase, or sometimes, Riemann--Hilbert/nonlinear steepest-descent methods. In a very significant and unanticipated development during 2007--2009, C. Widom analyzed ASEP (the asymmetric simple exclusion process) with step initial data, a system to which the above algebraic tools cannot be applied. Nevertheless, in an algebraic/combinatorial/analytical tour de force, they were able to show that ASEP exhibited the same asymptotic RMT behavior as the integrable models. Spohn were the first to show that $h(x,t)$ converged to the Airy 2 process, but their argument was not rigorous (see for more information on spatial correlations). A basic question is whether KPZ is in the KPZ universality class. In other words, can one show rigorously that solutions of KPZ indeed have the KPZ scaling $3:2:1$? The first difficulty here is to show that the Cauchy problem for the non-linear stochastic KPZ equation indeed has a solution. Quastel, used results from the 2008--2009 work of Tracy and Widom on ASEP to find an explicit formula for the solution of the Cole--Hopf transformed KPZ equation with so-called ``narrow wedge'' initial data. Hammond (see for the strongest and most precise statement of the KPZ universality conjecture for the KPZ equation). Again for the stochastic heat equation with narrow wedge initial data, Corwin and Hammond were able to show tightness of the suitably $3:2:1$ scaled height function $h(x,t)$ in a ``good'' sense which implied convergence for suitable subsequences to limiting processes with ``good'' properties, but they were not able to show that the limits were unique and given by the physically anticipated process. The most challenging open problem regarding the KPZ equation is to prove $3:2:1$ KPZ universality in the strong sense of Corwin, Quastel and Remenik alluded to above, for solutions of the Cauchy problem of the KPZ equation for a wide set of initial data, and to identify the limiting process. Another open problem is to analyze solutions of KPZ at more than one space-time point. Johansson computed correlations for two space-time points for the Brownian LPP problem, from which it easily follows, in particular, that Brownian LPP exhibits $3:2:1$ KPZ scaling. Also, regarding the original longest increasing subsequence problem, KPZ universality for the fluctuations has been proved so far only for the uniform distribution on the permutations: The problem for the fluctuations with more general distributions is very much open. In another direction, it remains an open, and somewhat mysterious, problem to understand how Tracy and Widom's solution of ASEP actually ``works'', and to extend their method of solution to more general initial data (however, see, and more recently,). Developing such a perturbation...

KdV with almost periodic initial data

P / partially_solved | AMR 问题清单汇编

Consider the Korteweg--de Vries (KdV) equation u_t + u u_x + u_{xxx} =0 with initial data u(x, t=0) = u_0(x),\qquad x\in \mathbb{R}. In the 1970's, McKean and Trubowitz proved the remarkable result that if the initial data u_0 is periodic, $u_0(x+p)= u_0(x)$ for some $p>0$, then the solution $u(x,t)$ of (eq1) is almost periodic in time. This result leads to the following natural conjecture: The same is true if $u_0(x)$ is almost periodic, i.e., if the initial data is almost periodic in space, the solution evolves almost periodically in time. This is a very challenging problem with many new and unique features. For example, for $u_0(x)$ almost periodic, one does not know, by standard PDE methods, whether a solution $u(x,t)$ exists, even for a small time, never mind globally. In spectacular and seminal work over the last few years, D. Damanik and M. Goldstein, joined later by I. Binder and M. Lukic, have partially resolved this conjecture in the affirmative, namely, for small quasi-periodic analytic initial data with Diophantine frequencies, unique global solutions exist and are almost periodic in time. The key insight of Damanik et al.\ was how to utilize the formal integrability of KdV in an effective analytical manner. Not only are the arguments in Damanik et al.\ applicable to other (formally) integrable systems (for example proves a Toda lattice analog of the KdV theorem), but some of their arguments are also applicable to non-integrable systems. It is a natural, open and very challenging conjecture that the result of Damanik et al.\ remains true for (suitable) perturbations of KdV, i.e., for (suitable) perturbations of KdV, the Cauchy problem with (suitable) almost periodic initial data $u_0(x)$, has a unique global solution $u(x,t)$, which evolves almost periodically in time. After all, the finite-dimensional analog of this result is precisely the content of classical KAM theory. We note that such results for perturbations of KdV and the nonlinear Schr\"{o}dinger equation (NLS) with periodic initial data $u_0(x)$, have already been proved by S. Kuksin, T. Kappeler and others. With the discovery of quasi-crystals, one can anticipate, in particular, that interest in PDE problems on quasi-periodic backgrounds, will surely grow.

Lattice Gases and Antiferromagnetic Potts Models - Question 5

O / open | AMR 问题清单汇编

\quad (a) What is the sharp bound $C_{opt}(\Delta)$? Might 2Δ work? Is $C_{opt}(3) = 3$? What about regions of the q-plane other than discs centered at $q=0$?

(b) Can ``second-largest degree'' be improved to ``max flow''? (See [Sokal_00a, Section 7] for details.)

(c) Can one obtain a *sublinear*\/ bound for suitable subclasses of graphs?

- For theta graphs $\Theta_{s_1,\ldots,s_p}$ [consisting of a pair of endvertices connected by p internally disjoint paths of lengths $s_1,\ldots,s_p$] the answer is *yes*\/: there is a bound of order $p/\log p$ [Brown_et_al].

- For series-parallel graphs, I conjecture that the answer is *yes*\/ (again $p/\log p$) for maximum degree, and *no*\/ for second-largest degree or max flow; I am currently trying to prove these claims.

- For planar graphs, it is an open question.

Long-time behavior with non-generic initial data

P / partially_solved | AMR 问题清单汇编

The long-time behavior of the solution of the Cauchy problem for a great many integrable systems on the line is now well-understood, using, for example, the Riemann-Hilbert/steepest descent method. The method depends on full knowledge of the nature of the spectrum of the associated Lax operator. For systems such as KdV, MKdV, defocusing NLS and the Toda lattice, for example, one is able to describe the solution asymptotically in complete detail for general initial data. But for focusing NLS, where the associated AKNS Lax operator T is non-self-adjoint (here we make contact with Problem 7), the situation is different. For generic T (i.e. an open dense set of T's in any reasonable topology) the spectrum consists of the real line, where the spectrum is absolutely continuous, together with a finite number of simple eigenvalues (corresponding to solitons) off the real axis. The analysis of the long-time behavior of focusing NLS with such generic initial data proceeds in a straightforward manner similar to KdV, MKdV, etc. For general initial data, however, the situation is more complicated. For example, let $z_0>0$ be any positive number and let D be any arbitrarily small open disk in the complex plane centered at z_0, such that $D\subset\{z\,:\,\mathbb{R}e z>0\}$. Let D^+ denote the intersection of D with the upper half plane, and let $u(z)$ be an arbitrary function analytic in D^+, and continuous in $\overline{D^+}$. Let $B=\{z\in D^+\,:\, u(z)=0\}$. Then there exists (Zhou) an AKNS operator T with infinitely smooth, rapidly decaying coefficients with the property that each point in B is an $L^2(\mathbb{R})$-eigenvalue of T. In other words, there exist (non-generic) operators T with Schwartz space coefficients which have L^2 spectrum accumulating on the real line at an essentially arbitrary rate. It is a very interesting question to determine what effect such singularities would have on the long-time behavior of the solution of NLS. In particular, recalling that focusing NLS provides a model for data transmission along communication cables, are the effects measurable? The difficulty that we encounter here is not limited to situations where the associated Lax operator is non-self-adjoint. Even in situations when the associated operator is self-adjoint, but of order greater than two, similar difficulties can arise. This is true, in particular, for the Boussinesq equation, where the associated Lax operator is third order. The long-time behavior of the solutions of the Boussinesq equation with general initial data is a very interesting problem with many challenges. Even in the case with generic initial data the situation is only partially understood.

Multi-matrix models and models with an external field

P / partially_solved | AMR 问题清单汇编

There has been considerable progress (Kuijlaars,...) in understanding basic statistics such as the correlation functions for the 2-matrix random matrix model, and also matrix models with a source. The key element in these developments has been the successful extension by Kuijlaars et al of the Riemann-Hilbert/steepest descent method to 3×3 Riemann-Hilbert problems. So far only the simplest situations have been considered. In order to consider the generic situation, one must, in particular, extend the Riemann-Hilbert/steepest descent method to $n\times n$ Riemann-Hilbert problems. This is a challenging problem which would have important implications, not only for random matrix models, but also for problems in other areas, such as Pad\'e-Hermite approximations and irrationality questions for distinguished real numbers, and multi-orthogonal polynomials.

Multivariate analysis

S / solved | AMR 问题清单汇编

Random matrix theory was introduced into theoretical physics by Wigner in the 1950s in his study of neutron scattering resonances, but as a subject, RMT goes back to the work of statisticians at the beginning of the 20th century. Recently, advances in RMT have opened the way to the statistical analysis of data sets in cases where the number of variables is comparable to the number of samples, and both are large. One might, for example, be interested in the daily temperature in hundreds of cities around the world, over a 365 day time period. At the technical level, one considers the statistics of the singular values of (appropriately centered and scaled) $p\times n$ matrices $M=(M_{ij})$, where $p\sim n\to\infty$. Here p is the number of variables and n is the sample size. More precisely, one centers the M_{ij}'s around their sample averages, $$ M_{ij}\to\hat M_{ij}=M_{ij}-\frac1n\sum_{k=1}^n M_{ik}, $$ and considers the eigenvalues $l_1\geq\cdots\geq l_p\geq0$ and associated eigenvectors $w_1,\dots,w_p$ of the $p\times p$ sample matrix $S=\frac1n \hat M \hat M^T$. The l_i's and w_i's are known as the principal component eigenvalues and eigenvectors, respectively. In Principal Component Analysis (PCA) ``significant'' dimension reduction in the data occurs if the first few principal components $l_1, l_2,...$ account for a ``high'' proportion of the total variance $\operatorname{tr} S=\sum_{j=1}^p l_j$. A common model for the variables M_{ij} is to assume that they follow a (real) p-variate Gaussian distribution $N_p(\mu,\Sigma)$ with mean μ and covariance matrix Σ. Thus the columns $(M_{1j}, M_{2j},\dots, M_{pj})^T$ provide n independent samples for $N_p(\mu,\Sigma)$. Using recent results from RMT, much has now been proved about the statistics of $l_1, l_2,...$ as $p,n\to\infty$, $p/n\to\gamma\in(0,\infty)$, in the case $\Sigma=I$. In particular, we know that in the limit, l_1, appropriately centered and scaled, satisfies the Tracy-Widom distribution for the largest eigenvalues of a GOE matrix. However, most interesting applications involve so-called spiked populations, a terminology introduced by Johnstone, i.e. situations where most of the eigenvalues $\eta_1,...,\eta_p$ of Σ are equal to a common value, say 1, but the first few eigenvalues are greater than 1. Thus $$ \eta_1\geq\eta_2\geq\cdots\geq\eta_k>\eta_{k+1}=\cdots=\eta_p=1 $$ for some fixed $k<<p$. It is a major problem in multivariate analysis to analyze the statistics of the eigenvalues $l_1, l_2,...$ as $p,n\to\infty$, $p/n\to\gamma\in(0,\infty)$ for such spiked populations. There are very interesting phase transitions in the theory. For example if $\eta_1>1+\sqrt{\gamma}$, then, as $p\sim n\to\infty$, l_1 emerges from the Marchenko-Pastur continuum $\bigl((\sqrt\gamma-1)^2,(\sqrt\gamma+1)^2\bigr)$, where most of the l_j's tend to accumulate, and almost surely $$ l_1\to\eta_1 \cdot \Bigl(1+\frac{\gamma}{\eta_1-1}\Bigr)>(1+\sqrt\gamma)^2\,. $$ In the spiked, complex case, i.e. when the columns $(M_{1j},M_{2j},...,M_{pj})^T$ are sampled from the complex p-variate Gaussian distribution, much is known about the asymptotic distribution of the l_j's, as $p,n\to\infty$, $p/n\to\gamma\in(0,\infty)$. By contrast in the real case, apart from a.s. convergence of the l_i's, very little is known about their asymptotic distributions. In the spiked, complex case the analysis is enabled by a particular technical tool, the Harish-Chandra-Itzykson-Zuber formula: unfortunately, no analog of this formula is known in the real case. While there are relatively few applications of complex spiked populations, knowledge of the asymptotic distributions of the l_i's for real spiked populations would have immediate applications to a wide variety of problems in signal processing, genetics and finance.

Non-self adjoint spectral problems

P / partially_solved | AMR 问题清单汇编

Much is now known, theoretically and also numerically, about the spectrum of self-adjoint operators. This is in great contrast to the situation regarding non-self-adjoint operators, where the spectral theory is far more subtle and numerical schemes must overcome significant, inherent instabilities. The heart of the difficulties and instabilities lies in the following fact: in the self-adjoint case $A=A^*$, the resolvent $(A-\lambda)^{-1}$ is bounded by the distance of λ to the spectrum of A, but in the non-self-adjoint case, this is no longer true, as we see already in the 2×2 case, $A=\begin{bmatrix}0 n\\0 0\end{bmatrix}$, $n\to\infty$. In recent years, a number of authors (e.g. Trefethan, Davies,...) have initiated a systematic approach to non-self-adjoint spectral problems, notions such as pseudospectrum have come into prominence, and other authors have conducted in depth studies of particular non-self-adjoint spectrum problems which arise in practice. For example, in analyzing the semi-classical limit of the focusing NLS equation, one must analyze the spectrum of the associated AKNS operator $T(h)$, as Planck's constant h goes to zero. The operator is non-self-adjoint, and as h goes to zero more and more eigenvalues, corresponding to solitons, emerge in the complex plane. It is of critical importance to the analysis of the semi-classical limits for NLS to determine where in the plane, and at what rate, the eigenvalues accumulate. The difficulty in doing this, theoretically and numerically, is illustrated by the following fact: the spectrum of $T(h)$ off the real axis is a discrete set, whereas the numerical range of $T(h)$ is an open subset of the plane. Nevertheless, every point λ lying in the numerical range of $T(h)$ is an eigenvalue of $T(h)$ to all orders in h, $\|(T(h)-\lambda)u\|=O(|h|^k)$ for any $k\geq 1$, for some $u=u(h)$, $\|u\|=1$. In the language of Kruskal, the computation of the spectrum of $T(h)$ is a problem ``beyond all orders.'' Much has been done (Kamvissis-Miller-McLaughlin, Tovbis-Venakides-Zhou,...) in analyzing the semi-classical limit for NLS in special situations where the spectral problem can be solved explicitly. The spectral problem with general data, both for NLS and also other related non-self-adjoint problems, however, is far from understood, and poses a great challenge whose resolution is still only in the initial stages.

numerical computation with random data

P / partially_solved | AMR 问题清单汇编

Standard algorithms to compute the eigenvalues of a random matrix H are completely integrable Hamiltonian systems (see). The question raised in was: What happens if we try to marry these two integrabilities? This question was taken up by P. The authors in then recorded \tau_{\epsilon, n, \mathcal{A}, \mathcal{E}}(H) \equiv \frac{T_{\epsilon, n, \mathcal{A}, \mathcal{E}}(H)- \langle T_{\epsilon, n, \mathcal{A}, \mathcal{E}}\rangle}{\sg_{\epsilon, n, \mathcal{A}, \mathcal{E}}}, where $\langle T_{\epsilon, n \mathcal{A}, \mathcal{E}}\rangle$ and $\sigma^2_{\epsilon, n, \mathcal{A}, \mathcal{E}}$ are respectively the sample average and sample variance for $T_{\epsilon, n,\mathcal{A}, \mathcal{E}}(H)$ computed for a very large sample of matrices $H\in \mathcal{E}$. Trogdon raised the question of whether the universality results in were limited to eigenvalue algorithms, or whether they were present more generally in numerical computations. And indeed in the authors found similar universality results for a wide variety of numerical algorithms, including; more general eigenvalue algorithms such as the Jacobi algorithm, and also algorithms for Hermitian ensembles,; the conjugate gradient and GMRES algorithms to solve linear $n\times n$ systems $Hx=b$, H and b random,; an iterative algorithm to solve the Dirichlet problem $\Delta u=0$ on a random star-shaped region $\Omega \subset \mathbb{R}^2$ with random boundary data f on $\partial \Omega$, and; a genetic algorithm to compute the equilibrium measure for orthogonal polynomials on the line, and was also for a decision making process in recent laboratory experiments of Yu. Thus the Toda algorithm with stopping time $T^{(1)}(H)$ is an algorithm to compute the largest eigenvalue of a given matrix

17339 | AMR-080-0006

numerical solution of integrable systems

P / partially_solved | AMR 问题清单汇编

Solutions of the Cauchy problem for linear dispersive equations can be expressed in terms of Fourier integral operators. This is a very challenging problem in numerical analysis. Again the problem of the solution of the Cauchy problem is in two parts. Concerning the second problem, in a very significant development starting in 2011, S. Olver introduced a methodology to solve RHP's numerically and applied this methodology to compute solutions of the Painlev\'e II equation, which has its own Riemann--Hilbert formulation. Rather than a single, or several, open problems, what we have here is an ``open program'', viz., to apply the Olver/Deconinck--Olver--Trogdon methodology to solve the many different numerical problems for integrable systems as they arise. Particularly difficult are situations where the forward problem is not self-adjoint, as in the case of focusing NLS. It remains an open problem (see) to solve the forward problem for focusing NLS with general smooth initial data, and then implement the RHP methodology, to obtain the solution of the Cauchy problem in the small dispersion limit $\epsilon=\hbar\downarrow 0$. At the technical level, the difficulty in solving the forward problem is that the relevant physical quantities only appear, in the language of Martin Kruskal, ``beyond all orders''. The forward problem for focusing NLS should, of course, be seen as one more example of the general open problem of computing the spectrum of non-self-adjoint problems (see, e.g., N. Dyson in the 1960's, followed by in the 70's, have contributed to the analysis of F_s as $s\to\infty$ (see P. In a striking development in 2008, F. Bornemann devised a very general and flexible method to evaluate Fredholm determinants, and he then applied the method to compute a variety of determinants arising in modern mathematical physics, including F_s. Although Fredholm determinants were introduced more than 100 years, it is surprising that, prior to Bornemann's work, no such general method to evaluate Fredholm determinants numerically and accurately was developed. However, the behavior of the eigenfunctions for finite values of s, a problem of great practical interest, presents a serious numerical challenge (a priori, the problem is ill conditioned), which was taken up only very recently by A. A related open problem concerns the Airy operator A_s with kernel $\frac{A_i(\lambda) A'_i(\mu)- A'_i(\lambda) A_i(\mu)}{\lambda-\mu}$ acting on $L^2(s,\infty)$ (here $A_i(\lambda)$ is the standard Airy function). Bothner, confirming an earlier conjecture of C. It is an open problem to analyze the behavior of the eigenfunctions $\tilde{u}_j(s)$ as $s\to\infty$, and to compute their behavior for finite s. Finally, in 2005 (see), the idea was raised of a ``Painlev\'e project'', which would provide a forum to assemble all current information on the algebraic, analytical and numerical properties of the Painlev\'e

Painlev\'e equations

O / open | AMR 问题清单汇编

What I have in mind here is not a specific problem, but a project, a very large scale project. The six (nonlinear) Painlev\'e equations form the core of ``modern special function theory.'' The role that the classical special functions, such as the Airy, Bessel, and Legendre functions, started to play in the 19th century, has now been greatly expanded by the Painlev\'e functions. Increasingly, as nonlinear science develops, people are finding that the solutions to an extraordinarily broad array of scientific problems, from neutron scattering theory, to PDEs, to transportation problems, to combinatorics,..., can be expressed in terms of Painlev\'e functions. What is needed is a project, similar to the Bateman project, or a new volume of Abramowitz and Stegun, devoted to the Painlev\'e equations. Much can be, and has been, proved regarding the algebraic and asymptotic properties of Painlev\'e functions. Here the role of integral representations and the classical steepest descent method in deriving precise asymptotics and connection formulae for the classical special functions is played, and expanded, by a Riemann-Hilbert representation of the Painlev\'e equations, together with the non-commutative steepest descent method introduced in 1993. Very little is known, however, beyond ad hoc calculations, about the numerical solution of the Painlev\'e equations. If $u(x)$ is the solution of the Painlev\'e II equation, say, which is asymptotic to the Airy function $Ai(x)$ as $x\to+\infty$, one would like to know, for example, the location of its poles in the complex x-plane. A modern ``Bateman Project: Painlev\'e equations'' would not/should not provide tables for such solutions. Rather, it should provide reliable, easy to use software to compute the solutions. Writing useful software for such nonlinear equations presents many challenges, conceptual, philosophical and technical. Without the help of linearity, it is not at all clear how to select a broad enough class of ``representative problems.'' The software should be in the form of a living document where new numerical problems can be addressed by a pool of experts as they arise. And at the technical level, how does one combine asymptotic information about the solutions obtained from the Riemann-Hilbert problem, together with efficient numerical codes in order to compute the solution $u(x)$ at finite values of x? I believe that the importance of the Painlev\'e Project will only grow with time. It should be viewed as creating a national resource and should probably be funded and led at the national level. The NIST Project ``Digital Library of Mathematical Functions'', where Peter Clarkson has a contribution on Painlev\'e functions, is an encouraging first step.

Perturbation theory for exactly solvable combinatorial problems

S / solved | AMR 问题清单汇编

The asymptotic behavior of a variety of combinatorial problems has now been analyzed in great detail. Here we have in mind Ulam's problem for the length of the longest increasing subsequence, the tiling problem for the Aztec diamond, the hexagon tiling problem, and the last passage percolation problem, amongst many others. In all cases, in an appropriate scaling limit, the statistical fluctuations in the systems at hand are described by random matrix theory. The asymptotic analysis, however, depends in a critical, and rigid way, on the underlying probability measures for the systems. For example, the analysis of the last passage percolation problem requires the waiting time w_i at each site i to be either geometrically or exponentially distributed (Johansson): if the statistics of the waiting times is neither geometric nor exponential, the analysis fails completely. What happens if the geometric distribution, say, is slightly perturbed? The challenge here is to develop an effective perturbation theory for such systems. One expects that the random matrix behavior of the fluctuations should persist. Related work on this problem has been done by Baik-Suidan and Bouchard-Martin (cf. Problem 10).

17353 | AMR-079-0012

Perturbation theory for infinite dimensional integrable systems

P / partially_solved | AMR 问题清单汇编

The bijective mapping properties of the scattering transform for a variety of integrable systems on the line between appropriate weighted Sobolev spaces have now been established (X. This has made it possible, in particular, to analyze (Deift-Zhou) the long-time behavior of the solution of the Cauchy problem for a variety of integrable systems in a fixed space without a ``loss of derivatives''. This in turn has made it possible to analyze perturbations of integrable systems. For example, Deift-Zhou analyzed the perturbed defocusing NLS equation iu_t+u_{xx}-2|u|^2u-\varepsilon V(|u|)u=0 $$ u(x,t=0)=u_0(x)\in H^{1,1}=\{f\in L^2\,|\, f', xf\in L^2(\mathbb{R})\}\,, $$ where $V(|u|)\sim |u|^p$ as $|u|\to0$, for some $p>2$ sufficiently large. In the perturbation theory of the linear Schr\"odinger equation -- when the term $-2|u|^2u$ is absent from (E:7) -- the key role in the analysis is played by the Fourier transform which diagonalizes the linear part of the equation. Such solutions do not decay uniformly in time (i.e. $\sup_{t,x\in\mathbb{R}}|u(x,t)|>0$) and this complicates the analysis of the perturbed equation enormously, as the perturbation term is no longer small with respect to $2|u|^2u$ (see above). The solution of (E:7) in the focusing case in the neighborhood of a k-soliton for (cubic) NLS ($k\geq2$), together with a detailed description of the long-time asymptotics, would be regarded as a very significant development in the theory of PDEs/Mathematical Physics. Here KAM methods apply and the authors show that certain finite dimensional tori corresponding to finite gap solutions in the integrable case survive under perturbation. The periodic problem is more complicated than the problem on the line because of the action of

Riemann-Hilbert Problem with non-analytic data

P / partially_solved | AMR 问题清单汇编

In many situations one is concerned with the asymptotic behavior of Riemann-Hilbert problems with exponentially varying data of the form $e^{in\phi(z)} r(z)$, $n \to \infty$. The Deift-Zhou nonlinear steepest descent method for such problems requires $\phi(z)$ to be analytic. The analyticity is used in two ways: to control the equilibrium measure associated with the problem, and then to deform the contour for the RHP. By contrast, the method only requires minimal smoothness for $r(z)$ (see eg. Deift-Zhou in the context of Problem 12 below). It is of considerable theoretical and practical interest to extend the nonlinear steepest descent method to situations where ϕ is no longer analytic, and has, for example, only a finite number of derivatives. For very interesting work on the analyticity problem, we refer the reader to a recent paper of Miller and McLaughlin. There is also interesting, older work due to Varzugin.

17429 | AMR-079-0009

The parking problem

P / partially_solved | AMR 问题清单汇编

A number of so-called ``transportation'' problems have now been analyzed in terms of RMT. These include: the ``vicious'' walker problem of M. Fisher, the bus problem in Cuernavaca, Mexico, the headway traffic problem on highways, and the airline boarding problem of Bachmat et al. Recently, researchers in London, Prague, and also Ann Arbor, have noticed an intriguing phenomenon. They found that the fluctuations in the spacings between cars parked on a long street exhibited RMT behavior. Furthermore, \v{S}eba found that there was a difference whether the street is two-way or one-way (On a two-way street, the cars park only on the right, while on a one-way street one of course has the option of also parking on the left.) Quite remarkably, for two-way streets \v{S}eba found GUE statistics, but for left-side parking on one-way streets he found GOE statistics. It is a great challenge to develop a microscopic model for the parking problem, in analogy, perhaps, with the microscopic model introduced by Baik et al. to explain the RMT statistics for the bus problem in Cuernavaca. \v Seba's recent, intriguing calculations on the parking problem can be found posted on the web.

The signed Hill threshold for binary exchange

P / partially_solved | AIM 研讨会问题汇编

Problem 1. Consider the three-body problem. Let \(E\) be the energy, \(C\) be the angular momentum, and \(L=C^2E\) for circular Euler motion. An exchange orbit is an unbounded solution with the property that the distance between one mass \(m_3\) and the binary \(\{m_1,m_2\}\) goes to infinity as \(t\to-\infty\), \(m_3\) exchanges with \(m_2\), and the distance between \(m_2\) and the binary \(\{m_1,m_3\}\) goes to infinity as \(t\to+\infty\). A solution has Hill type stability if the three bodies cannot undergo an exchange of binary. For exchange orbits, how close to \(1\) can

\[\frac{C^2E}{L} \]

be? (Christian Marchal)

When constrained minimizers gain symmetry

P / partially_solved | AIM 研讨会问题汇编

The printed source reads:

The grammatical slips “minimizers ... has,” “more symmetry that,” and “would ... by” occur in the original PDF and are not silently corrected here. In Chenciner's convention, the displayed \(D_6\) is the order-12 dihedral group; some later papers use \(D_{12}\) for that same abstract group.

The question is qualitative rather than a single yes/no conjecture. The answer developed below is:

1. symmetry enhancement is forced when invariance combines with rigidity of the minimizing set (uniqueness, isolation modulo phase, convexity, or sharp equality conditions); 2. it is not forced merely by minimizing in a symmetric class; and 3. the Italian-symmetry Kepler example admits a complete sharp proof by equality rigidity.

A birational I2(4)-diamond conjugacy and an obstruction for the A-row fiber

P / partially_solved | AIM 研讨会问题汇编

Problem 3.6. Relate both sides of the \(L\) identities under promotion, and both sides of the \(J\) identities under (birational) promotion/rowmotion.

8--9. Its exact question is:

Here \(\mathcal L(P)\) is the set of linear extensions and \(\mathcal J(P)\) the set of order ideals. The four rows of Theorem 3.4 immediately preceding the problem are labelled \(A,B,H,I\). To avoid relying on the missing fonts, write

\[R_n=[n]\times[n],\qquad S_n=J([2]\times[n-1]),\qquad Q_m=J^{m-2}([2]\times[2])\quad(m\geq2). \]

This normalization agrees with the sizes in Theorem 3.4: \(|S_n|=n(n+1)/2=|\Phi^+(A_n)|\), \(|S_5|=15=|\Phi^+(H_3)|\), and \(|Q_m|=2m=|\Phi^+(I_2(2m))|\). The theorem being refined is

\[\begin{aligned} |\mathcal L(\Phi^+(A_n))| &=2^{n(n-1)/2}|\mathcal L(S_n)|,\\ 2^n|\mathcal J(\Phi^+(A_n)\times[k])| &=|\mathcal J(S_n\times[2k+1])|;\\ |\mathcal L(\Phi^+(B_n))|&=|\mathcal L(R_n)|, &|\mathcal J(\Phi^+(B_n)\times[k])|&=|\mathcal J(R_n\times[k])|;\\ |\mathcal L(\Phi^+(H_3))|&=|\mathcal L(S_5)|, &|\mathcal J(\Phi^+(H_3)\times[k])|&=|\mathcal J(S_5\times[k])|;\\ |\mathcal L(\Phi^+(I_2(2m)))|&=|\mathcal L(Q_m)|, &|\mathcal J(\Phi^+(I_2(2m))\times[k])|&=|\mathcal J(Q_m\times[k])|. \end{aligned} \]

A compact-tail reduction for adelic unipotent measure rigidity

P / partially_solved | AIM 研讨会问题汇编

Problem 7 (L. Silberman). Extend the results on measure rigidity of unipotent flows to adelic setting.

It seems natural to expect (and is known in some cases) that the set of finite ergodic invariant measures for other dynamical systems with parabolic behavior has a manageable structure, which is possible to described in algebraic terms.

Suppose that \(H\) is a connected semisimple Lie subgroup of a Lie group \(G\), and let \(P\) be a parabolic subgroup of \(H\). One of manifestations of the measure rigidity of unipotent flows is the fact that every finite \(P\)-invariant measure on \(G/\Gamma\) is \(H\)-invariant (see [146]).

A finite generalized-toggle shadow of birational rowvacuation

P / partially_solved | AIM 研讨会问题汇编

Problem 5.4. Start with a known action in the birational (or piecewise-linear) realm and find the corresponding generalized toggle group action in the combinatorial realm. One such example of a birational map is the pentagram map.

The recovered statement is:

The PDF line-break artifact “combi-natorial” has been repaired to “combinatorial”; no mathematical wording was changed.

This is an open-ended construction problem, not a proposition with a fixed universal quantifier. Below, the known birational action is **birational order-filter rowvacuation** on a graded finite poset. Its finite combinatorial shadow is order-filter rowvacuation, an element of the generalized toggle group on the finite family of order filters. The construction is exact. It does **not** identify a toggle model for the pentagram map.

17478 | AIM-OTHER-0129

A finite-superlevel certificate for inhomogeneous minima

P / partially_solved | AIM 研讨会问题汇编

Conjecture 36 (E. Barnes, H. Swinnerton-Dyer [11]). For any quadratic form Q as above, the supremum m(Q) is rational and isolated. Both m(Q) and m2(Q) are attained at points with coordinates in the the splitting field of Q.

\[Q(X,Y)=aX^2+bXY+cY^2\qquad(a,b,c\in\mathbb Q) \]

be nondegenerate and indefinite, and suppose that it does not represent zero nontrivially over \(\mathbb Q\). Write \(\Delta=b^2-4ac\). Then \(\Delta>0\) and anisotropy over \(\mathbb Q\) is equivalent to \(\Delta\) not being a rational square, so the splitting field is the real quadratic field

\[K=\mathbb Q(\sqrt\Delta). \]

For \(x\in\mathbb R^2\), with its class also denoted by \(x\) in the torus \(\mathbb T^2=\mathbb R^2/\mathbb Z^2\), define

\[\mu_Q(x)=\inf_{z\in\mathbb Z^2}|Q(x+z)|, \qquad m(Q)=\sup_{x\in\mathbb R^2}\mu_Q(x). \]

If \(m(Q)\) is isolated from below in the value set of \(\mu_Q\), define

\[m_2(Q)=\sup\{\mu_Q(x):\mu_Q(x)<m(Q)\}. \]

Thus the recovered conjecture is that \(m(Q)\) is rational and isolated, and that both \(m(Q)\) and \(m_2(Q)\) are realized by torus classes admitting representatives in \(K^2\). The notation \(m_2(Q)\) is meaningful here only after isolation of \(m(Q)\) has been established. The PDF also warns, citing Godwin, that \(m_2(Q)\) itself need not be isolated.

17480 | AIM-OTHER-0139

A Fourier certificate and sharp limits for Gaussian eigenfunction value laws

P / partially_solved | AIM 研讨会问题汇编

Recovered Conjecture 41 (Marklof). For real numbers \(a<b\),

The record is Conjecture 41, attributed to J. Marklof, in the AIM workshop problem list *Emerging applications of measure rigidity* (dated 1 November 2004). The source PDF gives the surrounding conventions: \(X\) is a compact or finite-volume Riemannian manifold (possibly with boundary), \(dV\) is **normalized** Riemannian volume, and

\[0=\lambda _0<\lambda _1\leq\lambda _2\leq\cdots, \qquad -\Delta\phi_i=\lambda_i\phi_i, \qquad \int_X|\phi_i|^2\,dV=1, \]

with Dirichlet conditions if there is a boundary. Immediately before Conjecture 41, the list says that Berry's random-wave picture should in particular give the following statement for generic negatively curved compact manifolds.

\[\operatorname{Vol}\{x\in X:a\leq \phi_i(x)\leq b\} \longrightarrow \frac1{\sqrt{2\pi}}\int_a^b e^{-t^2/2}\,dt \qquad(i\to\infty). \]

Here the only normalization consistent with both the nearby definition and the right-hand side is

\[\operatorname{Vol}(A)=\int_A dV, \]

so \(\operatorname{Vol}(X)=1\). The order relation also requires real-valued eigenfunctions; because the Laplacian is real, a real orthonormal eigenbasis can be chosen. The quantifier “for every \(a<b\)” is the standard distributional reading of the displayed formula, not an additional phrase visible in the source.

Define the value-distribution probability measure

\[\nu_i=(\phi_i)_*dV, \qquad \nu_i(B)=\int_X\mathbf 1_{\{\phi_i(x)\in B\}}\,dV(x). \]

If \(\gamma=N(0,1)\), the conjecture is exactly \(\nu_i\Rightarrow\gamma\). Moreover

\[\int_{\mathbb R}t^2\,d\nu_i(t)=1. \]

On a closed connected manifold, every positive-eigenvalue eigenfunction is also orthogonal to the constants, hence \(\int t\,d\nu_i(t)=0\). (That centering conclusion is not asserted here for the more general Dirichlet-boundary convention.)

A graded fixed-point cone and the complete chain case

P / partially_solved | AIM 研讨会问题汇编

When \(P\) is minuscule or coincidental, is there a cyclic sieving phenomenon [for] the integer points of \(kO(P)\) under the induced actions of promotion/rowmotion?

This record is Problem 4.5 in the pre-workshop document for the AIM workshop *Dynamical algebraic combinatorics*. The source text, with line-break hyphenation removed and the visibly omitted word “for” supplied in brackets, asks:

Here \(O(P)\) is the order polytope. The paragraph following the question describes, for the type \(A\) positive-root poset, a statistic defined after applying Stanley's transfer map. If \(x_1,\ldots,x_p\) are the resulting chain-polytope coordinates, then the exponent is a linear form \(\lambda(x)\) that weights entries in column \(j\) of the enlarged triangular array by \(j-n-1\), for \(1\le j\le 2n+1\). The source proposes a \(q\)-Ehrhart interpretation of this column-weighted statistic and asks whether one can combine all dilations into one cone. This \(\lambda\) is distinct from the ordinary size statistic used later in this report for the separate minuscule-chain special case.

The preceding source paragraph fixes the intended action. The lattice points of \(kO(P)\) are height-\(k\) \(P\)-partitions, and the action is obtained by extending the usual order-ideal toggles piecewise-linearly. Although the same set can be encoded, up to reversing \(P\), as order ideals of \(P\times[k]\), this induced piecewise-linear action is generally **not** ordinary combinatorial rowmotion on that product.

A support obstruction and a Wasserstein repair of Conjecture 42

S / solved | AIM 研讨会问题汇编

Marklof after Feingold--Peres, in the AIM workshop list *Emerging applications of measure rigidity*.

Let \(X\) be a compact negatively curved surface normalized by \(\operatorname{area}(X)=4\pi\). Write

\[-\Delta\phi_i=\lambda_i\phi_i,\qquad N(\Lambda)=\#\{i:\lambda_i\leq\Lambda\}\sim\Lambda . \]

For real \(a\in C_c^\infty(S^*X,\mathbb R)\) with \(\int_{S^*X}a\,d\lambda=0\), the printed source defines

\[\boxed{\quad \xi_i(a)=\lambda_i^{1/4} \left|\langle\operatorname{Op}(a)\phi_i,\phi_i\rangle\right|. \quad} \]

The classical autocorrelation quantity is

\[V(a):=\int_{-\infty}^{\infty}\int_{S^*X} a(xg^t)a(x)\,d\lambda(x)\,dt , \]

where \(g^t\) is the geodesic flow. As \(\Lambda\to\infty\), the source conjectures

\[\tag{1} \frac1{\Lambda}\sum_{\lambda_i\leq\Lambda}\xi_i(a)^2 \longrightarrow V(a) \]

and, for every interval \(I\subset\mathbb R\),

\[\tag{2} \frac1{\Lambda} \#\left\{i:\lambda_i\leq\Lambda: V(a)^{-1/2}\xi_i(a)\in I\right\} \longrightarrow \frac1{\sqrt{2\pi}}\int_I e^{-t^2/2}\,dt . \]

Section 6.3 and A. Katok's suggestion about polygonal billiards start after the discussion of Conjecture 42 and are not part of it.

The same paragraph says that Luo and Sarnak proved, for the modular surface, a quantum-variance asymptotic involving a quadratic form \(B\) related to but distinct from \(V\). The workshop bibliography identifies its reference [169] as Sarnak's survey and its proof reference [126] as Luo--Sarnak.

Accumulation from above: simple-object and unbounded-rank reductions

P / partially_solved | AIM 研讨会问题汇编

There are accumulation points from below for $\operatorname{FPdim}(X)$ for an object in a fusion category or $[M:N]$ for finite depth subfactors. Are there any accumulation points from above?

It adds: “Are there non-integer accumulation points?” and notes that there are no accumulation points for $\operatorname{FPdim}(\mathcal C)$ itself.

The wording agrees with Problem 9.30 in the AIM workshop document *Classifying Fusion Categories*. The immediately preceding Problem 9.29 asks for a non-number-theoretic way to rule out the remaining Haagerup-family vine, which helps explain the graph-theoretic context.

The following quantifiers are made explicit.

- Let $\mathscr F_{\rm all}$ be the union, over all fusion categories over $\mathbb C$, of the FP dimensions of all nonzero objects. - Let $\mathscr F_{\rm simp}$ be the analogous union restricted to simple objects. - Let $\mathscr I_{\rm fd}$ be the set of Jones indices of finite-depth finite-index subfactors (with repeated realizations identified). - A number L is an accumulation point **from above** of a set $S\subset\mathbb R$ if there are distinct $s_n\in S$ with $s_n>L$ and $s_n\to L$. By passing to a subsequence, one may and will require $s_n\downarrow L$ strictly. “From below” is defined with $s_n<L$ and an increasing subsequence.

Thus infinitely many categories realizing one fixed number do not produce an accumulation point. Also, a finite bipartite graph of norm λ supplies only a possible numerical index λ^2; it is an actual finite-depth subfactor index only when the required principal-graph/connection/flatness data exist.

Admissibility-certified periodic paths for triangles and the 2026 polygon-existence preprint

P / partially_solved | AIM 研讨会问题汇编

Question 46 (A. Katok). Construct periodic orbits for triangular billiards.

Every acute triangle has one obvious periodic orbit, but it is not known whether a general acute triangle has other periodic orbits. It is also not known whether a general obtuse triangle has at least one periodic orbit. Periodic orbits were constructed for some special classes of triangles. A computer-aided proof using McBilliards was reported to show that every triangle with all angles less than 100 degrees has a periodic orbit.

For rational triangles and polygons, unfolding produces a compact flat surface. The number \(N(T)\) of periodic-orbit families of length at most \(T\) has upper and lower quadratic bounds. Quadratic asymptotics was known for special tables, but not stated for rational polygons in general.

This record is Question 46, attributed to A. Katok, in the June 2004 AIM workshop list *Emerging applications of measure rigidity*. Inspection of page 19 of the original PDF verifies the following statement.

The source then notes nonuniformity near the \(30\)-\(60\)-\(90\) triangle. The PDF itself misspells “Schwartz” as “Schwatz,” repeats “any” in “for any given any \(\varepsilon\),” and contains line-break hyphenation; these are source typographical errors, not mathematical ambiguities.

There is one important implicit convention. A nonsingular periodic path on a rational flat surface lies in a cylinder of parallel closed geodesics. Thus a finite quadratic \(N(T)\) cannot count all individual initial conditions; it counts maximal cylinders or periodic families, under a specified convention.

17503 | AIM-OTHER-0016

An orbit-code criterion and the complete type-A2 case

P / partially_solved | AIM 研讨会问题汇编

Let \(W\) be a finite Weyl group of rank \(n\), let \(c=s_1\cdots s_n\) be a Coxeter element, let \(h\) be the Coxeter number, and put \(N=|\Phi^+(W)|=nh/2\). If \(w_0(c)\) is the \(c\)-sorting word for the longest element, set

\[Q=c\,w_0(c). \]

The set \(\operatorname{Asoc}(W,c)\) consists of the \(N\)-element position subsets \(P\) of \(Q\) for which the selected letters, in order, form a reduced word for \(w_0\).

\[Q\,\psi(Q)\ \sim\ c^{h+2}, \]

where \(\sim\) allows commuting adjacent commuting generators. Thus \(P\subset Q\) is represented in the completed word by the doubled position set \(P\sqcup\psi(P)\). This repair is forced already in type \(A_2\): \(Q=12121\), so literal \(QQ\) is not the alternating word \((12)^5\), whereas \(Q\psi(Q)=12121\,21212=(12)^5\).

Write \(\rho=\operatorname{Camb}_c\) for the nonnesting \(c\)-Cambrian rotation on order ideals of \(\Phi^+(W)\). In the notation imported from the preceding record,

\[\rho=\operatorname{Tog}_{\operatorname{inv}(w_0(c))}\operatorname{Tog}^{+}_{\operatorname{inv}(w_0(c))}, \]

where the positive toggle fixes the simple roots and agrees with the usual order-ideal toggle on nonsimple roots.

The recovered conjecture is the following explicit recipe. For \(I\in J(\Phi^+(W))\), form

\[(I,\rho I,\rho^2I,\ldots,\rho^{h+1}I). \]

In the \(k\)-th copy of \(c\) in \(c^{h+2}\), select \(s\in S\) exactly when its simple root \(\alpha_s\) lies in \(\rho^kI\). Conjecture 3.1 asserts that the resulting position set is the doubled encoding of an element of \(\operatorname{Asoc}(W,c)\), and that the resulting map is a bijection intertwining \(\rho\) with noncrossing Cambrian rotation.

The superscript-looking “1” after “bijaction” is a footnote marker (“a bijection induced by an action”), not part of the formula. Those lines begin the next problem and are not part of Conjecture 3.1.

Andre-Oort status and rectangular CM closure classification

S / solved | AIM 研讨会问题汇编

Conjecture 51 was proved in the case when the dimension of the Zariski closure is one assuming generalized Riemannian hypothesis (see [203]).

The phrase “generalized Riemannian hypothesis” is reproduced here because it is what the source prints. The intended term is the **Generalized Riemann Hypothesis (GRH)**; reference [203] is A. Yafaev, *A conjecture of Yves André*, then a 2004 preprint.

Correcting only grammar, the mathematical assertion is:

André-Oort closure formulation. Let \(S\) be a (pure) Shimura variety and let \(\Sigma\) be any set of special points of \(S\). Every irreducible component of

\[\overline{\Sigma}^{\mathrm{Zar}} \]

is a special subvariety. Equivalently, the closure is a finite union of special subvarieties.

The quantifier is “any set,” not merely a sequence, a Galois-stable set, or a dense set. By convention a special subvariety is irreducible; the entire closure need not be.

Angular-factor dichotomy for triangular billiards

P / partially_solved | AIM 研讨会问题汇编

Question 47 (A. Katok). Prove ergodicity for triangular billiards with irrational angles.

It was proved that the set of ergodic (topologically transitive) triangular billiard table is residual in the sense of Baire category (see [103, 99]). However, it seems unknown whether the set of ergodic billiard tables has positive measure. It is easy to see that rational billiards cannot be ergodic. On the other hand, it was shown in [196] that if an irrational billiard table is very well approximable by a rational one, then it is ergodic. In the case when one of the angles of a triangles is rational, there is a useful unfolding procedure (see [189]) that may lead to a proof of ergodicity.

Also, it seems unknown whether there is a weakly mixing polygonal billiard (see [76] for a positive result in this direction). It was shown in [5] that typical interval exchange transformation which is not defined by a cyclic permutation is weakly mixing (see also [98, 192]).

Chain toggles on an antichain: CSP, homomesy, and an affine lift

P / partially_solved | AIM 研讨会问题汇编

Explore these (and other) generalized toggle groups, look for homomesy and CSP, look at piecewise-linear and birational liftings.

For example, one could look at toggling chains, then the piecewise-linear extension should be to the order complex.

The operative text is:

The source immediately before the problem defines generalized toggles as follows. For a finite set \(E\), a family \(\mathcal L\subseteq 2^E\), and \(e\in E\), the toggle \(t_e\) adds or removes \(e\) when the resulting set remains in \(\mathcal L\), and otherwise fixes the state. It explicitly lists chains of a poset among the examples.

This report answers all three concrete directions-homomesy, cyclic sieving, and a piecewise-linear lift-for the chain family of an antichain. It does not propose a birational lift.

Common toggle energy and obstructions for locomotion

P / partially_solved | AIM 研讨会问题汇编

Perhaps it is better to approach the birational toggle group from above. Certain algebraic combinations of the variables are invariant under all the birational toggles.

Problem 4.9. Can we say what those combinations are? Can we then characterize the birational toggle group as being precisely the group of birational transformations that preserve those algebraic combinations?

Apropos of invariance under toggling, we mention the case of the full toggle group on the poset \([2]\times[2]\). Of the 24 orders in which one can compose all 4 toggles, 8 are not conjugate to rowmotion or promotion or their inverses; indeed, the PL and birational versions of these compositions were shown by Einstein to be of infinite order. Nevertheless, there are things to be proved about the map (called “locomotion” for present purposes). For instance, the pictures at http://jamespropp.org/locomotion.pdf, which shows some projections of an orbit of locomotion strongly suggests that the orbit lies in a 2-dimensional surface in \(\mathbb R^4\); that is, there are two conserved quantities, of which we know only one. Likewise, experimental studies suggest that other quantities are homomesic under locomotion, in an appropriately asymptotic sense of the word “average.” (Similar, polyhedral pictures appear when one replaces birational locomotion by PL locomotion.)

来源字段：http://aimath.org/pastworkshops/dac_preworkshop.pdf

17516 | AIM-OTHER-0116

Compact diagonal orbits and product minima

P / partially_solved | AIM 研讨会问题汇编

Conjecture 30 (G. Margulis). For every compact set \(K\) of \(\mathrm{SL}(3,\mathbb R)/\mathrm{SL}(3,\mathbb Z)\), there are only finitely many closed \(A\)-orbits contained in \(K\).

Its mathematical statement is:

Checking the official PDF, pp. 12--13, recovers the displayed definitions

\[F_B(x)=\prod_{i=1}^{3}\left(\sum_{j=1}^{3}a_{ij}x_j\right), \qquad B=(a_{ij})\in M_3(\mathbb R), \] \[\Delta(F_B)=\det B, \qquad m(F_B)=\inf_{x\in\mathbb Z^3\setminus\{0\}} \left|\frac{F_B(x)}{\Delta(F_B)}\right|. \]

The definition requires \(\det B\ne0\), an assumption implicit in the quotient by \(\Delta(F_B)\). The next sentence in the PDF reads, with the source's apparent numbering slip, "Then Question 30 is equivalent to the following question," followed by Question 31:

\[\text{For every }\varepsilon>0, \quad [\varepsilon,\infty)\cap\{m(F)\}\text{ is finite.} \tag{Q31} \]

They are quoted here only to recover the boundary and to audit the reformulation; this attempt owns only AIM-OTHER-0116.

We use the positive diagonal identity component

\[A=\{\operatorname{diag}(a_1,a_2,a_3):a_i>0,\ a_1a_2a_3=1\}. \]

Passing to all real diagonal matrices changes only finite sign components and does not affect compactness or finiteness assertions.

来源字段：https://aimath.org/WWN/measrigid/measrigid.pdf

17517 | AIM-OTHER-0118

Compact thresholds and the two logical gates for the cubic multiplicative spectrum

P / partially_solved | AIM 研讨会问题汇编

Question 31 (G. Margulis). Show that, for every \(\varepsilon>0\), \[[\varepsilon,\infty)\cap \{m(F_B):B\in\mathrm{GL}_3(\mathbb R)\} \quad\text{is finite.} \]

and then continues with the heading “5.4” and a definition of sets \(C_s\).

The notation is supplied by the immediately preceding paragraph of the source. For an invertible real \(3\)-by-\(3\) matrix \(B=(a_{ij})\), put \[F_B(x)=\prod_{i=1}^3\left(\sum_{j=1}^3a_{ij}x_j\right), \qquad \Delta(F_B)=\det B, \] and \[m(F_B)=\inf_{x\in\mathbb Z^3\setminus\{0\}} \left|\frac{F_B(x)}{\Delta(F_B)}\right|. \] Thus the exact recovered problem is:

The assumption \(\Delta(F_B)\ne0\) is forced by the displayed quotient and by the preceding description as a product of three independent linear forms. The absolute value makes the sign of \(\det B\) immaterial.

The PDF says just before Question 31 that “Question 30 is equivalent to the following question”; the preceding numbered item is in fact **Conjecture 30**, the finiteness of closed diagonal orbits in compact subsets. Sections 5 and 7 below audit the hypotheses needed to make this advertised reformulation logically exact.

17520 | AIM-OTHER-0092

Conditions for expanding analytic curves and an exact toral model

P / partially_solved | AIM 研讨会问题汇编

Question 17 (N. Shah). Under what condition on \(\gamma\) do we have \[a^n\nu\overset{w^*}{\longrightarrow}\lambda \qquad(n\to\infty)? \]

Let \(L\) be a Lie group, let \(G\) be a closed subgroup of \(L\), and let \(\Lambda\) be a lattice in \(L\). For a semisimple element \(a\in G\), define its expanding horospherical subgroup by

\[U=\{g\in G:a^{-n}ga^n\longrightarrow e\text{ as }n\to\infty\}. \]

Assume that \(Gx_0\) is dense in \(L/\Lambda\). If a probability measure on \(U\), absolutely continuous with respect to Haar measure, is pushed to \(Ux_0\), then Shah's earlier theorem gives convergence of its \(a^n\)-translates to the probability Haar measure \(\lambda\) on \(L/\Lambda\). The proposed refinement takes an analytic curve

\[\gamma:[0,1]\longrightarrow U \]

\[\nu=(t\longmapsto\gamma(t)x_0)_*(dt). \]

The recovered question is therefore:

The PDF's word “Recently” begins the following status sentence; it is not part of the question. That sentence says that Shah had solved the case \(L=\mathrm{SO}(m,1)\), \(G=\mathrm{SO}(n,1)\), \(m>n\), under the sufficient condition that \(\gamma([0,1])\) lies in neither a proper affine subspace nor an \((n-2)\)-dimensional sphere in \(U\cong\mathbb R^{n-1}\). The PDF then states Conjecture 18 for arbitrary ambient Lie groups containing \(G=\mathrm{SO}(n,1)\).

All actions in the setup are left actions on \(L/\Lambda\), and the definition \(a^{-n}ua^n\to e\) is the convention making \(U\) expanding under positive powers of \(a\).

Effective Oppenheim heights and an exact four-square transfer family

S / solved | AIM 研讨会问题汇编

Question 35 (G. Margulis). Give an effective estimate \(T=T_Q(\varepsilon)\) such that there is an \(x\in\mathbb Z^d\) with \[0<|Q(x)|<\varepsilon,\qquad \|x\|<T. \]

After correcting one duplicated word in the printed PDF, they are:

- \(Q\) is a nondegenerate indefinite quadratic form in \(d\ge 3\) variables; - \(Q\) is not a scalar multiple of a quadratic form with rational coefficients.

The recovered question is therefore:

The subscript on \(T_Q\) is inserted only to expose the dependence that the next sentence of the source explicitly requires: the estimate must depend on the Diophantine properties of the coefficients of \(Q\).

There are three source-recovery issues.

1. The PDF itself prints “nondegenerate indefinite definite quadratic form.” The second “definite” is a typographical duplication. “Indefinite” is forced both by the Oppenheim context and by every cited result. 2. The canonical record continues past “5.6.” into a new discussion of binary rational forms and inhomogeneous minima. That text is not part of Question 35. The present job stops at the end of the sentence about the upcoming work of Margulis and Götze. OCR strings such as `ax 21`, `cx 22`, and stray `>` symbols belong to that unrelated Section 5.6 extraction. 3. The source calls the inequalities \[|Q(x)|<\varepsilon,\qquad \|x\|<T \] an “easier question,” but does not repeat \(x\in\mathbb Z^d\), does not say \(x\ne0\), and drops the strict lower inequality. Literally this is trivial by \(x=0\). The surrounding sentence can reasonably carry over integrality, but even the reading \(x\in\mathbb Z^d\setminus\{0\}\) can be trivial when \(Q\) has an integral isotropic vector. This defect is not silently repaired below. The later published work formulates its small-value conclusion for a **nonzero integral point** and allows \(|Q(x)|<\varepsilon\); Question 35 itself has the unambiguous strict condition \(0<|Q(x)|\).

The source uses an unspecified norm. The new results below use the sup norm \(\|x\|_\infty\). Any two fixed norms on \(\mathbb R^d\) are equivalent, so this changes constants but not the exponents or conclusions.

Equivariant unfolding reduction for polygonal quantum limits

P / partially_solved | AIM 研讨会问题汇编

Problem 44 (J. Marklof). Classify all quantum limits of the eigenfunctions of a polygonal billiard.

According to the Berry--Tabor conjecture ...". The PDF confirms that this is the start of the next subsection, about eigenvalue statistics of integrable systems and quadratic forms; it is not part of Problem 44.

The surrounding AIM definitions matter. In §6.1, the eigenfunctions satisfy the **Dirichlet** boundary condition, and a "quantum limit" means a weak-* limit on configuration space of \[|u_j(x)|^2\,dx, \qquad -\Delta_Pu_j=E_j u_j,\quad \|u_j\|_{L^2(P)}=1,\quad E_j\to\infty. \] Thus this is the primary reading below. Modern papers also call phase-space semiclassical measures quantum limits; §3 distinguishes that stronger notion.

17535 | AIM-OTHER-0004

Exact rational counterexamples to the middle-runner conjecture

S / solved | AIM 研讨会问题汇编

1. Subscripts and the distinction between instantaneous and averaged positions were flattened: the PDF uses \(p_i(t)\) for the \(i\)-th sorted position and then \(p_i\) for its full-period average. In this report the latter is written \(\bar p_i\) to avoid ambiguity. 2. Everything beginning "2.2 Cores" belongs to the next section and is not part of Conjecture 2.1.

There are \(n\) runners on a unit circular track. Their speeds are nonzero and commensurable, and they need not start at the marked starting line. At time \(t\), sort their representatives in \([0,1)\): \[p_1(t)\leq p_2(t)\leq\cdots\leq p_n(t). \] For a common return period \(L\), define \[\bar p_i=\frac1L\int_0^L p_i(t)\,dt. \] The conjecture is \[\boxed{\bar p_i+\bar p_j=1\qquad\text{whenever }i+j=n+1.} \] For odd \(n\), the central case asserts that the average middle position is \(1/2\).

The phrase "though runners are not required to start at the starting line" naturally permits arbitrary initial phases. The counterexample below also works when all runners start together at the same unmarked point, so it does not depend on the more permissive independent-phase reading.

17543 | AIM-OTHER-0061

Fusion-ring extensions: the one-new-simple grading obstruction

P / partially_solved | AIM 研讨会问题汇编

Develop existence, obstruction, and classification machinery for enlarging a fusion category by sectors whose multiplication is multi-valued according to a fusion ring, rather than deterministically indexed by a group. Near-group rules, obtained by adjoining one noninvertible sector to a pointed ring, are the basic test case.

This agrees exactly with Problem 9.2 in the official notes from the 2011 AIM workshop *Classifying Fusion Categories*. The immediately preceding workshop section, “New from old,” lists \(G\)-extensions-categories \(\mathcal D=\bigoplus_{g\in G}\mathcal D_g\) with \(\mathcal D_e=\mathcal C\)-among standard constructions. It also lists short exact sequences, equivariantization, de-equivariantization, Hopf monads, and other genuinely categorical constructions. The next open problem asks for “fusion rings” in place of groups.

That context supports the following reconstruction:

Three notions must not be conflated.

1. A **faithful \(H\)-graded extension** has \[\mathcal D=\bigoplus_{h\in H}\mathcal D_h,\qquad \mathcal D_h\otimes\mathcal D_k\subseteq\mathcal D_{hk}. \] The product of degrees is a single degree. 2. A **categorification of a fusion ring** asks for a monoidal category whose Grothendieck ring is the prescribed based ring. Ring associativity is only the decategorified first step; an associator satisfying the pentagon is additional data. 3. “A category graded by a fusion ring” is not part of the standard definition of a grading. If \(bc=\sum_dN_{bc}^d d\), multiplying two sectors may feed several sectors. One must specify what the sectors are, what multiplicity \(N_{bc}^d\) means categorically, and which bimodule tensor products and coherence maps realize it.

17548 | AIM-OTHER-0085

Horospherical Radon measures and a centralizer-character obstruction

P / partially_solved | AIM 研讨会问题汇编

Question 11 (F. Ledrappier, O. Sarig). Let \(G\) be a noncompact semisimple Lie group of rank one, \(\Gamma\) a discrete subgroup of \(G\), and \(U\) a horospherical subgroup of \(G\). What are the \(U\)-ergodic Radon measures on \(G/\Gamma\)? In particular, are they either carried by closed \(U\)-orbits or given by the harmonic function construction?

A \(u_t\)-invariant measure \(\mu\) is called squashable if the centralizer of \(u_t\) contains an invertible nonsingular transformation that does not preserve \(\mu\). F. Ledrappier and O. Sarig showed recently that for a normal coabelian subgroup \(\Gamma\) of a uniform lattice, the only nonsquashable \(u_t\)-ergodic measure on \(\mathrm{SL}(2,\mathbb R)/\Gamma\) is Haar. If \(\Gamma\) is conilpotent, then any \(u_t\)-ergodic measure on \(\mathrm{SL}(2,\mathbb R)/\Gamma\) is squashable except possibly the Haar measure.

Invariance certificates and obstructions for representation-ball averages

P / partially_solved | AIM 研讨会问题汇编

What is the limiting distribution of \(\mu_T\) as \(T\to\infty\)?

The exact Question 19 occupies the end of Section 4.3; all text beginning with “4.4. For irrational \(\alpha\), the sequence \(\{\alpha n^2\pmod 1\}\) ...” belongs to the next section and is not part of this record.

The preceding paragraph supplies the missing setup. Let \(G\) be a semisimple Lie group acting linearly on a finite-dimensional real vector space \(V\), equipped with a norm. Fix \(p\in V\), and put \[R_T=\{g\in G:\|gp\|<T\}. \tag{1.1} \] The AIM text assumes that the stabilizer \(G_p\) is finite, says that this makes \(R_T\) compact, fixes a lattice \(\Gamma<G\), and defines \(\mu_T\) to be the pushforward to \(G/\Gamma\) of normalized Haar measure on \(R_T\). Question 19, contributed by N. Shah, is:

The next sentence says that examples are known in references [53, 73] and motivates the problem by distribution of \(\Gamma\)-orbits on \(G/H\), either when \(\Gamma\cap H\) is a lattice in \(H\) or when \(\Gamma H\) is dense in \(G\). The official bibliography identifies [53] as Eskin--Mozes--Shah (1996) and [73] as the 2004 preprint of Gorodnik--Weiss, published in 2007.

Literal counterexamples and an exact torus model for sparse unipotent samples

P / partially_solved | AIM 研讨会问题汇编

Let \(G\) be a Lie group, \(\Gamma\) a lattice in \(G\), and \(U=\{u(t)\}\subset G\) a one-parameter Ad-unipotent subgroup. Suppose that, for \(x\in G/\Gamma\), the orbit \(Ux\) is dense in \(G/\Gamma\).

Section 4.1 fixes the following setting:

Question 15 (attributed to G. Margulis) then asks for equidistribution of \[\{u(t_n)x\}_{n\geq 1} \] for each of \[\text{(1) }t_n=\lfloor n^\alpha\rfloor\quad(\alpha>1),\qquad \text{(2) }t_n=\lfloor P(n)\rfloor,qquad \text{(3) }t_n=p_n, \] where \(P\) is a polynomial and \(p_n\) is the \(n\)-th prime.

The continuation on the next page says that A. Venkatesh had suggested a proof of (1) for \(\alpha\) close to 1, recalls almost-everywhere pointwise ergodic results for these sequences, and explicitly warns that \(\lfloor n^\alpha\rfloor\) and \(n^\alpha\) behave differently. Thus the floor in the recovered question is intentional.

Measure-rigidity obstructions require an entropy and genuine-rank gate

P / partially_solved | AIM 研讨会问题汇编

Question 6 (D. Fisher). Do the new results on measure rigidity for actions of higher rank abelian groups give rise to obstructions to smooth or continuous actions of a higher rank abelian group on a compact manifold?

Some basic obstructions for smooth volume preserving actions of higher rank abelian groups are already known, see particularly work of H. Hu and A. Katok. The question is whether one can use results on measure rigidity to obtain more information.

The results on arithmetic quotients for actions of semisimple groups and their lattices have no straightforward analogues here, since the proofs of those results use not only Ratner's theorem but applications of the cocycle superrigidity theorems to cocycles which are necessarily only measurable. Though some cocycle superrigidity theorems are known for particular classes of actions of higher rank abelian groups, none of these apply to measurable cocycles because of the Dye theorem [43] and its generalizations [154, 37].

Question (E. Lindenstrauss). Let $\mathbb A'$ be defined as the ring of adeles, but the product is taken over a subset of places of $\mathbb Q$, and Γ an “irreducible” lattice in $\mathrm{SL}(2,\mathbb A')$. What are the finite ergodic $D(\mathbb A')$-invariant measures on $\mathrm{SL}(2,\mathbb A')/\Gamma$?

The sentence beginning “3.6. One may also expect measure rigidity...” is the heading and opening sentence of the next subsection. It is not part of the question.

The preceding paragraph in the PDF defines $\mathbb A$ as the full adele ring, calls D the diagonal subgroup of SL_2, and records Lindenstrauss's full-adelic Haar-uniqueness result. Thus the most natural reconstruction for a set V of places is $$\mathbb A_V=\prod_{v\in V}'\mathbb Q_v, \qquad G_V=\mathrm{SL}_2(\mathbb A_V) =\prod_{v\in V}'\mathrm{SL}_2(\mathbb Q_v),$$ where the finite-place restrictions are with respect to $\mathbb Z_p$ and $\mathrm{SL}_2(\mathbb Z_p)$, respectively. If V is finite, these are ordinary products. An infinite unrestricted Cartesian product would generally not be locally compact, so the usual definitions of Haar measure and lattice would no longer apply.

The source does not define the scare-quoted word “irreducible.” For a finite product, the standard strong reading is that the projection of Γ to every nonempty proper subproduct is dense (variants ask only nondiscreteness or impose conditions factor by factor). For an infinite restricted product, even the intended family of projections is unspecified. This ambiguity is mathematically consequential and prevents a literal all-cases classification.

The AIM quotient is the left-action space G_V/Γ. Most cited papers use $\Gamma\backslash G_V$ with a right action. The inversion homeomorphism $$\iota:G_V/\Gamma\longrightarrow \Gamma\backslash G_V, \qquad \iota(g\Gamma)=\Gamma g^{-1},$$ intertwines left translation by d with right translation by d^{-1}. Since $D_V=D_V^{-1}$, the two formulations have exactly the same invariant measures and entropies (with d replaced by d^{-1}).

Piecewise-linear Panyushev dynamics and the complete affine A2 case

S / solved | AIM 研讨会问题汇编

Can we give piecewise-linear and birational analogues of Armstrong, Stump, and Thomas' proof (see [AST13]) of Panyushev's Conjecture 2.1 (see [Pan09]) asserting homomesy of antichain cardinality under rowmotion?

For the type-\(A_n\) positive-root poset \(P\), let \(\mathcal O(P)\) and \(\mathcal C(P)\) be the order and chain polytopes, let \(\rho:\mathcal O(P)\to\mathcal O(P)\) be piecewise-linear rowmotion, and let \(\phi:\mathcal O(P)\to\mathcal C(P)\) be Stanley's transfer map. It defines

\[\rho'=\phi\circ\rho\circ\phi^{-1}:\mathcal C(P)\longrightarrow\mathcal C(P). \]

On vertices, \(\rho'\) is Panyushev complementation. The source then defines

\[f(y)=\sum_{p\in P}y_p \]

as the piecewise-linear analogue of antichain cardinality.

1. The canonical field `number: "2.1"` is not the number of this AIM item. It was picked up from the citation to **Panyushev's Conjecture 2.1**. The AIM question itself is unnumbered text following AIM Conjecture 3.2. 2. The next sentence in the PDF is **Conjecture 3.3**, which asserts the \(n/2\) average. That sentence begins the next canonical record, AIM-OTHER-0019. It is used here only to identify the intended question and its subsequent status; it is not silently appended to this record.

17585 | AIM-OTHER-0120

Schmidt's weighted intersection conjecture

S / solved | AIM 研讨会问题汇编

Conjecture 32 (W. Schmidt). For every $(s,t\in[0,1])$, $$ C_s\cap C_t\ne\varnothing. $$

for $(0\le u\le1)$, $$ C_u=\left\{(\alpha,\beta)\in\mathbb R^2: \inf_{q\ge1}\max\left\{q^u\langle q\alpha\rangle, q^{1-u}\langle q\beta\rangle\right\}>0\right\}. $$ In this Diophantine-approximation context, $(\langle x\rangle)$ denotes distance to the nearest integer. Below it is written in the now-standard notation $$ \|x\|:=\min_{p\in\mathbb Z}|x-p|. $$

The recovered conjecture is therefore:

The source correctly notes that Schmidt's original 1983 question was the specific swapped-weight case $(s=1/3)$, $(t=2/3)$. The assertion for every pair of weights is the generalized form that became known as Schmidt's conjecture.

There is an endpoint subtlety in the displayed formula. Modern papers define the zero-weight coordinate to be omitted, so $$ \mathbf{Bad}(0,1)=\mathbb R\times\mathbf{Bad}, \qquad \mathbf{Bad}(1,0)=\mathbf{Bad}\times\mathbb R, $$ where $$ \mathbf{Bad}=\{x\in\mathbb R:\inf_{q\ge1}q\|qx\|>0\}. $$ The AIM formula literally retains the term $(q^0\|q\alpha\|)$. The endpoint lemma proved below shows that the two readings give exactly the same sets; no convention is silently imposed.

Solved Hurwitz cyclic sieving conjecture and a dihedral order diagnostic

S / solved | AIM 研讨会问题汇编

Conjecture 3.7 (recovered). For \(w=w_0\) and for \(w=\gamma\), \((\operatorname{Red}_T(c_W),F_W(q),T_w)\) exhibits the cyclic sieving phenomenon, using the cyclic orders \(2h\) and \(nh\), respectively.

The surrounding subsection of the AIM pre-workshop document supplies the notation. Let \(W\) be a finite irreducible Coxeter group of rank \(n\), with reflection set \(T\), degrees \(d_1,\ldots,d_n\), Coxeter number \(h\), and a fixed Coxeter element \(c_W\in W\). Write

\[\operatorname{Red}_T(c_W)= \{(t_1,\ldots,t_n)\in T^n:t_1\cdots t_n=c_W\}. \]

On such words the positive Hurwitz generator is

\[T_i(\ldots,t_i,t_{i+1},\ldots) = (\ldots,t_{i+1},t_{i+1}t_it_{i+1},\ldots). \]

For \(w=s_{i_1}\cdots s_{i_k}\in\mathfrak S_n\) reduced, set \(T_w=T_{i_1}\cdots T_{i_k}\); braid relations make this independent of the reduced expression. To avoid the source's reuse of \(c\), denote by \(w_0\in\mathfrak S_n\) the longest element and by \(\gamma=s_1s_2\cdots s_{n-1}\in\mathfrak S_n\) the standard Coxeter element. Set

\[F_W(q)=\prod_{i=1}^n\frac{[ih]_q}{[d_i]_q}, \qquad [a]_q=\frac{1-q^a}{1-q}. \]

The recovered conjecture is:

The repairs are: `wo` is \(w_0\), `Two` is \(T_{w_0}\), `Red T(c)` is \(\operatorname{Red}_T(c_W)\), and the displayed product is \(\prod_i[ih]_q/[d_i]_q\). The superscript `2` sentence about the identities AJ and HJ is a footnote belonging to Problem 3.6, not to this conjecture; `10` is a page number. The subsequent quadrangulation and conjugation comments are context, not part of the displayed conjecture.

The dihedral root-order product and the meaning of order 2h

P / partially_solved | AIM 研讨会问题汇编

Birational toggles in \(w_0(c)\) root orders appear to continue to have order \(2h\) in type \(A_n\). This fails, for example, in type \(D_4\) (as does birational rowmotion).

Conjecture 3.2. Birational toggles in \(w_0(c)\) root orders have order \(2h\) in the coincidental types \(A,B,H_3,I_2(m)\).

None is part of Conjecture 3.2.

The phrase “root order” imports the notation of §3.1 and Williams's thesis. If

\[w_0(c)=a_1a_2\cdots a_N, \]

then its inversion-root sequence is

\[\beta_k=a_1a_2\cdots a_{k-1}(\alpha_{a_k}),\qquad 1\leq k\leq N. \]

This is the \(w_0(c)\) root order. With the composition convention used in the source,

\[\operatorname{Tog}_{\beta_1\beta_2\cdots\beta_N} =T_{\beta_N}\circ\cdots\circ T_{\beta_2}\circ T_{\beta_1}; \tag{2} \]

thus \(T_{\beta_1}\) acts first. Williams calls the combinatorial version of (2) the nonnesting \(c\)-Kreweras complement. Conjecture 3.2 concerns its birational lift, not automatically birational rowmotion: a reflection/root order need not be a linear extension of the root poset.

There is an important convention issue. “Has order \(2h\)” can mean either:

1. the rational map has **minimal** positive order exactly \(2h\); or 2. \(2h\) is a **period/common exponent**, so the minimal order merely divides \(2h\).

These readings differ already in rank one and in even dihedral type. The results below resolve the entire \(I_2(m)\) family and make that distinction explicit.

17603 | AIM-OTHER-0083

The three-measure Katok Finsler flow

P / partially_solved | AIM 研讨会问题汇编

Conjecture 9 (A. Katok). The only ergodic probability measures for this example are the smooth measure and the measures supported on periodic orbits.

“This example” is defined by the immediately preceding paragraph: Katok's 1973 non-reversible Finsler metric on S^2, whose geodesic flow is ergodic and has two periodic phase-space orbits. The hyphen in “ex-ample” is only line breaking. The appended sentence beginning “3.3. Since a polygonal billiard ...” starts the next subsection and belongs with AIM-OTHER-0084, not Conjecture 9.

The referent is an approximation-by-conjugation existence construction, not one uniquely specified formula. Katok starts with the round geodesic flow and an S^1-isometry action, constructs an ergodic energy-level Hamiltonian flow, proves there are no periodic trajectories outside the exceptional set, and identifies its closed geodesics with the round geodesics invariant under the isometry action. For axial rotations of S^2, these are the two oriented phase-space lifts of the equator. Katok explicitly notes that orientation counting matters for a non-symmetric metric.

This is not the elementary integrable irrational-wind/ellipsoid model also often called a Katok or Katok--Ziller example. Those explicit models transparently have two closed geodesics but have extra first integrals and are not the full-bundle ergodic construction selected by AIM.

Transfer principles for counting compact flats

P / partially_solved | AIM 研讨会问题汇编

Question 23 (H. Oh). Determine the asymptotics of the number of compact flats with volume less than T as $T\to\infty$.

A flat is a totally geodesic zero-curvature submanifold; maximal flats arise from a Cartan subgroup A. Oh had proved that only finitely many compact maximal flats have bounded volume.

The exact assigned question is:

The PDF then distinguishes a different known/accessible sum in the compact case, $$ \sum_{\substack{F\ \mathrm{regular}\\ \operatorname{systol}(F)<T}} \operatorname{Vol}(F). $$ Here “regular” means that a shortest closed geodesic of F points in a regular direction, and $\operatorname{systol}(F)$ is its length. This is **not** a volume cutoff and should not be conflated with Question 23.

On $\Gamma\backslash G$, write μ_F for Lebesgue measure on a compact A-orbit F, $\bar\mu_F=\mu_F/\operatorname{Vol}(F)$, and $$ \nu_T=\frac{\sum_{\operatorname{Vol}(F)<T}\mu_F} {\sum_{\operatorname{Vol}(F)<T}\operatorname{Vol}(F)},\qquad \bar\nu_T=\frac{\sum_{\operatorname{Vol}(F)<T}\bar\mu_F} {\#\{F:\operatorname{Vol}(F)<T\}}. $$ The question whether these measures converge is Question 24 in the next record; the definitions are retained here only because they legitimately occur in the assigned source record and motivate the comparison below.

17606 | AIM-OTHER-0019

Type-A antichain rowmotion homomesy and an endpoint certificate

S / solved | AIM 研讨会问题汇编

Conjecture 3.3. The statistic F is homomesic under ρ', with average $n/2$.

That later material is not part of this problem.

The definitions immediately preceding the conjecture are essential. Let $$ P=\Phi^+(A_n)=\{[i,j]:1\leq i\leq j\leq n\} $$ be the type-A_n positive-root poset, where $[i,j]$ denotes $\alpha_i+\cdots+\alpha_j$. Let $\mathcal O(P)$ and $\mathcal C(P)$ be its order and chain polytopes. Let $\rho:\mathcal O(P)\to\mathcal O(P)$ be piecewise-linear (PL) rowmotion and let $\phi:\mathcal O(P)\to\mathcal C(P)$ be Stanley's transfer map. Set $$ \rho'=\phi\circ\rho\circ\phi^{-1},\qquad F(y)=\sum_{p\in P}y_p. $$ The recovered statement is:

The source then proposes a birational analogue. In standard modern normalization, the birational transfer coordinates are positive labels on the same triangular array, the multiplicative statistic is their product, and the stated $\widehat F$ is its logarithm. With lower and upper boundary labels both equal to 1, the conjectured logarithmic average is 0. The source reported symbolic checks only for $n\leq3$.

Type-B middle Narayana and Baxter slices with a Fuss-cardinality obstruction

P / partially_solved | AIM 研讨会问题汇编

Problem 2.9. Is there a corresponding multi-noncrossing partition model?

One would expect that this has something to do with the root configuration, and the case \(k=1\) is well-known in classical types. Using the correspondence between the type \(B_n\) root poset and \([n]\times[n]\), the case \(k=2\) for the type \(B_n\) root poset corresponds to certain Narayana numbers [SW12]. Similarly, the case \(k=3\) corresponds to Baxter numbers [Dil14]. Both of these have noncrossing models: Narayana numbers are well-known to be noncrossing partitions with a specified number of blocks; N. Reading has given a combinatorial description of Baxter permutations as noncrossing diagrams on a horizontal line of points using arcs that stay above or below the points [Rea14].

Uniform gap transfer and an elementary irrational diagonal family

P / partially_solved | AIM 研讨会问题汇编

Let \(Q\) be a nondegenerate positive definite quadratic form of dimension \(d\geq3\).

Conjecture 34 (Davenport--Lewis). Suppose that \(Q\) is not a multiple of a rational form. Then the gaps between consecutive elements of the set \[\{Q(x):x\in\mathbb Z^d\} \] go to zero as \(Q(x)\to\infty\).

The record has lost the hypotheses printed at the start of Section 5.5.

Thus the recovered AIM statement is: if \(Q\) is a nondegenerate positive-definite real quadratic form in \(d\geq3\) variables and its coefficient matrix is not a real scalar multiple of a rational matrix, then the gaps between successive **distinct** elements of \(Q(\mathbb Z^d)\) tend to zero. Positivity makes the distinct value set locally finite, so it can be ordered

\[0=v_0<v_1<v_2<\cdots, \]

and the conclusion is \(v_{j+1}-v_j\to0\). Repeated representations of one value are not additional elements.

There is a historical qualification. Later primary papers describe the original Davenport--Lewis conjecture with \(d\geq5\), whereas the AIM list places Conjecture 34 in a section beginning with \(d\geq3\). This report treats the AIM formulation: its \(d\geq5\) part is solved and its \(d=3,4\) extension remains open.

Unitary F-gauges are equivalent to categorical unitarizability

S / solved | AIM 研讨会问题汇编

For unitary theories, we can choose a gauge so the F matrices formed by the $6j$ symbols are unitary, and the braiding matrices are diagonal with respect to a certain basis. Can this happen for some non-unitary fusion category?

Is the unitarity of the F matrices equivalent to unitarity?

Does a complex fusion category admit a unitary F-gauge if and only if it is unitarizable? If it is braided, what then follows for its R-matrices?

Universal Mechanisms of Biological Pattern Formation

O / open | Oberwolfach 报告问题汇编

What physical or chemical mechanisms produce the recurring periodic patterns in plants, including phyllotaxis and ridges, and in mollusk shells, and why do only a few patterns-often similar to patterns elsewhere in nature and in laboratory experiments-dominate in both?

Wall avoidance, root detection, and gaps between local-rigidity hypotheses

P / partially_solved | AIM 研讨会问题汇编

Conjecture 2. If in Conjecture 1 the group A is not contained in a wall of a Weyl chamber of the split Cartan subgroup D, then any C^1-small perturbation of the action of A on G/Γ is C^∞-conjugate to the action of A defined by a continuous homomorphism from A to D.

Its preceding paragraph is Conjecture 1, and the damaged record is:

Thus “Conjecture 1 the” must be replaced by “Conjecture 2. If in Conjecture 1”. Conjecture 1 assumes G connected semisimple, $\Gamma<G$ an irreducible lattice, $D<G$ a split Cartan, and $A<D$ closed with $\dim A>1$. The PDF immediately says Katok--Spatzier proved Conjecture 2 when $A=D$.

Yang's resolution and a finite-stabilizer compactness correction

S / solved | AIM 研讨会问题汇编

Conjecture 18 (N. Shah). The same result holds for all Lie groups L con-taining G = SO(n, 1).

Recovered Conjecture 18. Let L be a Lie group containing $G=\operatorname{SO}(n,1)$, let Λ be a lattice in L, and let $a\in G$ have expanding horospherical subgroup U. Suppose Gx_0 is dense in L/Λ. If an analytic curve $\gamma:[0,1]\to U\cong\mathbb R^{n-1}$ is contained in neither a proper affine subspace nor an $(n-2)$-sphere, then its curve measure ν satisfies $$ a^k_*\nu\longrightarrow m_{L/\Lambda}\qquad(k\to\infty). $$

Context-only header for AIM-ALGEBRAIC_GEOMETRY-0220 (Problem 3 in Degenerations in Algebraic Geometry)

AIM-ALGEBRAIC_GEOMETRY-0223 | Exact gluing and transverse-padding formulas for plane-curve H-constants

Context-only setup for AIM-ALGEBRAIC_GEOMETRY-0224 (Problem 5 in Degenerations in Algebraic Geometry)

AIM-ALGEBRAIC_GEOMETRY-0228 | Exact convex certificates from square Nagata rays

Duplicate extraction of Problem 7 (already in AIM-ALGEBRAIC_GEOMETRY-0227).

AIM-ALGEBRAIC_GEOMETRY-0230 | A quadratic-to-cubic maximal-rank wall and its pure resolution

Truncated or non-self-contained workshop heading/fragment

AIM-ALGEBRAIC_GEOMETRY-0235 | Real smoothness of osculating Schubert curves

Context-only setup and theorem statements for AIM-ALGEBRAIC_GEOMETRY-0236 (Problem 10 in Degenerations in Algebraic Geometry)

AIM-ALGEBRAIC_GEOMETRY-0247 | Singular free-summand descent and a cuspidal top-Chern counterexample

Multi-problem workshop PDF dump or non-problem placeholder

AIM-ALGEBRAIC_NUMBER_THEORY-0039 | Exact sparse-incidence dichotomy for tricanonically embedded curves

Multi-problem workshop PDF dump or non-problem placeholder

AIM-ALGEBRAIC_NUMBER_THEORY-0060 | Quantitative averages of function-field prime-tuple singular series

Multi-problem workshop PDF dump or non-problem placeholder

AIM-ALGEBRAIC_NUMBER_THEORY-0067 | Zarhin's cubic S3 theorem and propagated CM factors

Literature/reference comment attached to Problem 2 (AIM-ALGEBRAIC_NUMBER_THEORY-0066), not a standalone problem.

AIM-ALGEBRAIC_NUMBER_THEORY-0096 | Rational points, index transport, and the C_1^0 boundary

Historical remark (iv) attached to Question 11 (AIM-ALGEBRAIC_NUMBER_THEORY-0095), not a standalone problem.

AIM-ALGEBRAIC_NUMBER_THEORY-0115 | A withdrawn duplicate of the D4 and E6 cubic counting problems

Explicitly withdrawn problem entry ('Question 30. This problem has been withdrawn.') duplicating the cubic counting problems.

AIM-ANALYSIS-0059 | Explicit projective-space solution to item 9 of the 2016 complex Monge-Ampere list

Multi-problem workshop PDF dump or non-problem placeholder

AIM-ANALYSIS-0083 | A spectral multiplicity refinement of the Casazza DFT near-counterexample

Unrecoverable AIM statement:

AIM-ANALYSIS-0101 | A portable tail-certificate principle behind interlacing families

Informal workshop discussion comment about Kadison-Singer polynomial tools, not a mathematical problem statement.

AIM-ANALYSIS-0157 | A correction-transfer triangle for Polya, Riesz means, and normalized eigenvalue means

Multi-page workshop dump containing 15 distinct problems rather than a single problem statement.

AIM-ANALYTIC_NUMBER_THEORY-0102 | Conductor collisions in an aggregated workshop record

Workshop table of contents / multi-session dump, not a single mathematical problem.

AIM-ANALYTIC_NUMBER_THEORY-0105 | A spliced large-sieve/zeta record and a local 1-line zeta certificate

Unrecoverable AIM statement:

AIM-ARITHMETIC_GEOMETRY-0043 | Uniform degrees for splitting quadratic forms

Truncated or non-self-contained workshop heading/fragment

AIM-ARITHMETIC_GEOMETRY-0046 | Classification of an AIM test fixture

Website testing fixture ('Name of the problem block / Intro to problem block / This is the problem statement.'), not a mathematical problem.

AIM-ARITHMETIC_GEOMETRY-0047 | A self-identifying throw-away fixture

Website testing fixture ('Test introduction / the statement of a throw-away problem'), not a mathematical problem.

AIM-ARITHMETIC_GEOMETRY-0081 | Malformed aggregate and a genus obstruction to Sullivan's cover-density question

Unrecoverable AIM statement:

AIM-BIOLOGY-0001 | Identifiability of stage-resolved retinal vascular change in diabetes

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0002 | A conditional shunt-steal criterion for retinal oxygenation

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0003 | Repeatability-calibrated sequential warning from retinal microvascular monitoring

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0004 | Separating retinal barrier influx from delivery, volume, and clearance

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0005 | A deployable landmark model for imaging-based diabetic-retinopathy progression warnings

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0006 | A compensation and identifiability framework for aging, IOP, and ocular structure

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0007 | Flow certification for healthy-age retrobulbar Doppler comparisons

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0008 | Supply-demand thresholds for retinal oxygenation in light and darkness

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0009 | A two-number epithelial transport reduction with an aqueous-production identifiability test

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0010 | A rate-based criterion for targeting plastic tumor states

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0011 | A mechanism gate for resistance-driven drug scheduling

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0012 | A closure test from signaling dynamics to tumor growth

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0013 | A blinded finite-portfolio audit for preclinical-to-human prediction

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0014 | A feedback-aware clearance threshold for metabolism and signaling

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0015 | Geometry-specific transport thresholds for 2D and 3D tumor assays

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0016 | A size-phase audit for receptor, signaling, and drug-response variation

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0017 | Landmark selection can reverse metastatic and adjuvant drug rankings

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0018 | Nuisance-adjusted intervention criteria for testing biological model structures

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0019 | A coordinate-aware audit for uncertain model parameters

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0020 | Bounded disclosure delay, participation, and milestone thresholds

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0021 | A robust allocation certificate for student research clinics

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0022 | A dated funding pointer and a staged-funding decision rule

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0023 | What aggregate V1 suppression cannot identify

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0024 | A space-time exclusion certificate for visual-cortical route attribution

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0025 | A rate-delay abstraction certificate for filtered spiking circuits

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0026 | V1 saliency context and a delay margin for symmetry breaking

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0027 | When agreement is a complement, and when extra modalities help

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0028 | A clock-risk audit of the square-root distributed-synchrony code

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0029 | Generic views, Bayesian flexibility, and a falsifiable invariance test

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0030 | Auditing timing and measurement claims in a border-ownership workshop Q&A

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0031 | Peak-window bias and circuit nonidentifiability in push-pull response analysis

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0032 | A robust target-offset test for late 3D pop-out signals

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0033 | A model-discrimination and reporting certificate for Breakout Session I

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0034 | Shared-input model discrimination and recording-overlap identifiability

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0035 | Provenance-safe multidisciplinary priority setting

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0036 | Majority topology and the 0.66-or-1 branch-length question

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0037 | Exact counting with prescribed phylogenetic splits

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0038 | Exact split-residual certificates in BHV tree space

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0039 | Sharp scale-bounded comparison of BHV and Robinson-Foulds distance

Non-mathematical clinical / biological / grant administration workshop item

AIM-BIOLOGY-0040 | When concatenation is score averaging

Non-mathematical clinical / biological / grant administration workshop item

AIM-COMBINATORICS-0134 | Quarantining a test placeholder by an item-identifiability criterion

Multi-problem workshop PDF dump or non-problem placeholder

AIM-COMBINATORICS-0146 | Unique balance and a codegree-variance obstruction for the tetrahedron conjecture

Truncated or non-self-contained workshop heading/fragment

AIM-COMBINATORICS-0148 | An editorial placeholder and a two-axis non-recovery certificate

Multi-problem workshop PDF dump or non-problem placeholder

AIM-COMBINATORICS-0165 | Repairing the safe-completion reduction from rainbow reachability to Sullivan-2

Mid-proof split fragment from the reduction between Conjectures 6.1 and 6.4 (AIM-COMBINATORICS-0164), not an independent problem.

AIM-COMBINATORICS-0166 | The exact fresh-color safety criterion behind the Sullivan-2 reduction

Mid-proof split fragment following Conjecture 6.4 (AIM-COMBINATORICS-0164), not an independent problem.

AIM-COMBINATORICS-0169 | A surplus lattice for Seymour and Sullivan neighborhood inequalities

Truncated transition sentence before Conjecture 6.5, not a standalone problem.

AIM-COMBINATORICS-0170 | The exact interpolation among second-neighborhood inequalities

Second half of a truncated transition sentence before Conjecture 6.5, not a standalone problem.

AIM-COMBINATORICS-0173 | A tight overlap-core reduction for Conjecture 6.8

Truncated or non-self-contained workshop heading/fragment

AIM-COMBINATORICS-0175 | A cut-critical kernel for the vertexwise rainbow-cycle conjecture

Truncated or non-self-contained workshop heading/fragment

AIM-COMBINATORICS-0270 | Malformed perfect-graph workshop mega-record and an NP-certificate bridge

Unrecoverable AIM statement:

AIM-COMBINATORICS-0278 | The chromatic-to-divisibility implication hidden in a source fragment

Truncated or non-self-contained workshop heading/fragment

AIM-COMBINATORICS-0279 | An extraction fragment and an exact triangle-free list-coloring corollary

Mid-sentence PDF extraction splice ('Conjecture 2. Let G be an even-hole-free graph.'); actual Conjecture 2 is AIM-COMBINATORICS-0278

AIM-COMBINATORICS-0283 | Block-local safe edges for the Conforti--Rao conjecture

Mid-sentence PDF extraction fragment ('Conjecture 2 from the section Balanced Graphs.')

AIM-COMPUTATION-0001 | Overmerged factorization questions and a batched splitting criterion

Unrecoverable AIM statement:

AIM-COMPUTATION-0002 | A malformed composite record and an Artin--Schreier certificate family

Unrecoverable AIM statement:

AIM-COMPUTATION-0004 | Exact ridge reduction for Lévy PIDEs

Participant research-interest statement (Appendix A.1, Mariko Arisawa), not a standalone open problem.

AIM-COMPUTATION-0005 | Nuisance-adjusted information for semiparametric MRS design

Participant bio/discussion note (Appendix A.2, Enrico Capobianco), not a standalone mathematical problem.

AIM-COMPUTATION-0006 | Bellman residuals, policy performance, and coverage

Participant research-interest statement (Appendix A.3, Daniela de Farias), not a standalone open problem.

AIM-COMPUTATION-0007 | A finite-sample Rao-Blackwell diagnostic between Kalman and particle filtering

Talk outline (Appendix A.4, Simon Haykin), not an open problem.

AIM-COMPUTATION-0008 | Exact support and trace-controlled ellipsoidal reachability

Truncated participant note (Appendix A.5, Alexander Kurzhanski), not a standalone open problem.

AIM-COMPUTATION-0009 | From an approximate HJB value to implemented control

Participant research-interest statement (Appendix A.6, Harold Kushner), not a standalone open problem.

AIM-COMPUTATION-0010 | Certified weak-coupling tubes for structured reachability

Participant research-interest statement (Appendix A.7, Ian Mitchell), not a standalone open problem.

AIM-COMPUTATION-0012 | An intrinsic-dimension certificate for projected Hamilton--Jacobi equations

Participant research-interest statement (Appendix A.9, Stanley Osher), not a standalone open problem.

AIM-COMPUTATION-0013 | Coordinate-covariant orientation laws for no-trade regions

Participant research-interest statement (Appendix A.10, Daniel Ostrov), not a standalone open problem.

AIM-COMPUTATION-0014 | When frequency selectivity can and cannot improve multi-user capacity

Merged open-discussion session notes on wireless communication standards, not a standalone mathematical problem.

AIM-COMPUTATION-0015 | What is actually exponential in single-carrier equalization?

Merged open-discussion session notes on single-carrier vs. multi-carrier equalization, not a standalone mathematical problem.

AIM-COMPUTATION-0062 | An exact witness and certificate for a recorded negative answer

Status note ('Question 47 was answered in the negative by Bernd Sturmfels at the conference') attached to AIM-COMPUTATION-0061, not a standalone problem.

AIM-CONVEX_GEOMETRY-0012 | Four recovered problems and a normalization obstruction

Multi-problem workshop PDF dump or non-problem placeholder

AIM-CONVEX_GEOMETRY-0042 | Six recovered convex-geometric problems and an inradius lattice-point sandwich

Multi-problem workshop PDF dump or non-problem placeholder

AIM-CRYPTOGRAPHY-0006 | A reproducible challenge-instance profile

Community benchmark/challenge instance call rather than a mathematical open problem

AIM-CRYPTOGRAPHY-0007 | A capability-sound kernel for group-based protocol implementations

Software implementation library request rather than a mathematical open problem

AIM-DYNAMICAL_SYSTEMS-0006 | Letter involutions in no-repeat subshifts

Unrecoverable AIM statement:

AIM-DYNAMICAL_SYSTEMS-0018 | A centralizer-density invariant for tree automorphisms

Truncated or non-self-contained workshop heading/fragment

AIM-GEOMETRIC_GROUP_THEORY-0050 | Exact endomorphism monoids for the Artin family Z^k x F_n

Truncated or non-self-contained workshop heading/fragment

AIM-GEOMETRIC_GROUP_THEORY-0052 | Eliminating the center in the CAT(0) braid-group problem

Duplicate of canonical problem AMR-061-0102

AMR-061-0102 / p.800

AIM-GEOMETRIC_GROUP_THEORY-0080 | Universal rank-two injectivity for the generalized Tits map

Truncated or non-self-contained workshop heading/fragment

AIM-GEOMETRIC_GROUP_THEORY-0087 | Exact escape of exponent rectangles in Thompson's group F

Duplicate of canonical problem ALG-009

ALG-009 / p.211

AIM-GEOMETRIC_GROUP_THEORY-0147 | Editorial bridge to the Out(F_n) curve-complex-analogue problems

Unrecoverable AIM statement:

AIM-GEOMETRIC_GROUP_THEORY-0150 | A PDF section boundary and a reverse-stretch diagnostic for Outer Space

Mid-sentence PDF extraction fragment ('Problem 1.1?') plus Section 2 introduction; actual question is AIM-GEOMETRIC_GROUP_THEORY-0151

AIM-GEOMETRY-0085 | Finite exact certification of numerical Cohn--Elkies bounds

Truncated or non-self-contained workshop heading/fragment

AIM-GEOMETRY-0204 | A Hadamard row-deletion sieve and a 2026 phase-retrieval resolution

Multi-problem workshop PDF dump or non-problem placeholder

AIM-GEOMETRY-0223 | A spliced rigidity transition and a topological branch-locus reduction

Spliced transition fragment between Sections 5.1 and 5.2 of the geodesics problem list, not a standalone problem.

AIM-GEOMETRY-0227 | Source-boundary audit and invariant ledger for geodesic-flow conjugacy

Commentary continuation after Conjecture 5.2.1 (AIM-GEOMETRY-0226), not a standalone problem.

AIM-GEOMETRY-0229 | Entropy-volume context and an exact scaling/cover ledger

Literature status and transition fragment following Conjecture 5.3.1 (AIM-GEOMETRY-0228), not a standalone problem.

AIM-GEOMETRY-0233 | A transition fragment and bounded-degree simple lifts

Concatenated transition sentence and section header ('Question 5.4.1 above asks whether there are other examples. 5.6. Infinitely many simple closed geodesics.'), not a standalone problem.

AIM-GEOMETRY-0237 | Flat strips, counting conventions, and a width bound

Discussion continuation following Question 6.2.1 (AIM-GEOMETRY-0236), not an independent question.

AIM-GEOMETRY-0279 | The Cohn-Elkies implication in dimensions 8 and 24

Single commentary sentence ('Question 1 implies the complete solution to the sphere packing problem in dimensions 8 and 24.') attached to AIM-GEOMETRY-0278, not a standalone problem.

AIM-GEOMETRY-0288 | Status of the hyperkähler Kirwan comments and a plus-construction bridge

Extracted commentary (Comments 1.3-1.5) following Conjecture 1.1 (AIM-GEOMETRY-0287), not a standalone problem.

AIM-GEOMETRY-0299 | Contact convexity context and properness on a symplectization

Literature status commentary on Question 5.8 (AIM-GEOMETRY-0298) spliced with the next section header, not a standalone problem.

AIM-GEOMETRY-0300 | A boundary fragment and the specialization behind it

Incomplete sentence fragment ('Conjecture 1.1, but we state it again here in T. Hausel\'s formulation, for good measure:') preceding AIM-GEOMETRY-0301.

AIM-GEOMETRY-0344 | A finite recognition certificate for planar tropical fans

Outline bullet list of general research topics ('C.1 Relevant lines of research'), not a mathematical problem.

AIM-GEOMETRY-0369 | Distinguishing intrinsic and boundary order-three conformal operators

Spliced sentence fragment from Problem 11 and background prose before Problem 12, not a standalone problem.

AIM-GEOMETRY-0375 | Global descent and flat-torus classification for Lorentzian spinors

Unrecoverable AIM statement:

AIM-GEOMETRY-0392 | Exact-divergence form of a global conformal invariant

Mid-sentence split fragment from Problem 31 (AIM-GEOMETRY-0391), not a standalone problem.

AIM-GEOMETRY-0394 | A source and tractor-slot audit of Other routes to Q

Page-split fragment combining the end of Problem 32 with the background paragraph of Problem 33, not a standalone problem.

AIM-GEOMETRY-0397 | Generalized Q-operators on closed forms

Explanatory transition sentence between Problem 34 and Problem 35, not an open problem.

AIM-GEOMETRY-0410 | The function in a Weinstein structure: terminology and minimal data

Multi-problem workshop PDF dump or non-problem placeholder

AIM-GEOMETRY-0428 | A Fourier--Dolbeault model for Kohn--Rossi geometry

One-sentence talk log ('Question 1.32. Akahori discussed some problems involving understanding the geometry of Kohn-Rossi cohomology.') with no problem statement.

AIM-GEOMETRY-0431 | Source-boundary correction and a twisted-cohomology calculation

Talk log note ('Question 1.35. Eliashberg made some remarks on the above topics...') with no standalone problem statement.

AIM-GEOMETRY-0436 | A two-scale linking certificate for Reeb flows

One-sentence talk log ('Question 1.40. Mitsumatsu discussed something about linking numbers...') with no problem statement.

AIM-GEOMETRY-0437 | A structured audit of what HF=HM preserves

One-sentence talk log ('Question 1.41. Yi-Jen Lee gave some further discussion...') with no problem statement.

AIM-INFRASTRUCTURE-0001 | A rights-portability-cost rule for choosing educational assessment tools

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0002 | A deployment gate for open mathematical assessment

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0003 | A motivation-first deployment gate for educational technology

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0004 | An estimand-anchor-policy contract for educational data

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0005 | A version-aware evidence pipeline for input during educational-technology development

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0006 | Separating feedback content from the opportunity to revise

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0007 | Behavioral transfer and cycle-consistent course crosswalks

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0008 | From interaction traces to defensible collaboration evidence

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0009 | What an authenticity check can and cannot certify

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0010 | A role-specific causal evaluation contract for STACK

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0011 | A version-aware design for longitudinal studies of open assessment systems

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0012 | Blueprint alignment and exam-weight sensitivity

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0013 | A format-replacement-communication audit for short online assessment

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0014 | Relating questions to student goals without pretending to know the learner

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0015 | A distance-without-displacement audit

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0016 | A Coverage--Contract--Cut certificate for educational tool suites

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0017 | Decision-safe STACK reports and a governed user community

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0018 | A versioned closed-loop audit for STACK

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0019 | A trace-validity obstruction and engagement claim certificate

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0020 | A testable training-support-renewal framework for online instructional tools

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0021 | A barrier-lattice audit for lecturer adoption of online assessment

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0022 | Rank-safe credit for collaboration inside a contest

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0023 | Separating exposure from retained mastery under a curriculum time budget

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0024 | An access-validity workflow certificate for online assessment

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0025 | A dependence-robust certificate for informal learning

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0026 | A transport-and-adaptation certificate for structured pedagogy

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0027 | Auditable collaborative reinvention without false authorship claims

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0028 | A versioned research spine for curriculum innovation

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0029 | Construct-preserving portability beyond mathematics

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0030 | A versioned localization and transport certificate

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0031 | Participation-task dual randomization for contributor support and task evaluation

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0032 | Observation sufficiency for non-computational mathematical work

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0033 | A purpose-indexed evidence certificate for mathematical tasks

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0034 | A versioned robustness certificate for positive task impact

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0035 | Calibration-preserving encouragement in assessment feedback

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0036 | Sharp claim bounds for mathematical engagement

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0037 | A causal and decision framework for engaging institutions

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0038 | Certified open-world routing for a database of databases

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0039 | A censored lineage-and-cut audit for open-source sustainability

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0040 | A replicable and inclusive developer on-ramp

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0041 | A certifiable registry profile for mathematical visualizations

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0042 | A typed plural-paper certificate for mathematical communication

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0043 | A semantics-bound certified bridge between Lean and computer algebra

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0044 | A scope-locked robust decision certificate for Space Math

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0045 | Ordered proof traces for sound educational interoperability

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0046 | A claim-limited audit contract for open knowledge tracing

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0047 | A dual-fiber adequacy contract for the LaTeX ecosystem

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0048 | Provenance-closed workbook extraction

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0049 | Version-pinned workspace semantics for activities

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0050 | Context closure for stand-alone PreTeXt worksheets

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0051 | Context-closed fragments and version-pinned overlays

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0052 | A commuting dual-output contract for worksheet exercises

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0053 | A query-complete syllabus model for PreTeXt

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0054 | A role-separated worksheet portability contract

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0055 | Two closure tests for one-file sharing

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0056 | Certified landing-page staging for PreTeXt

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0057 | A semantic contract for journal-style theorem output

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0058 | A loss-accounted PreTeXt-to-JATS contract

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0059 | A contract for a truthful PreTeXt conversion atlas

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0060 | A sound resolver contract for links from extracted documents to a full PreTeXt publication

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0061 | Coherent numbering for extracted PreTeXt content

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0062 | Destination-aligned text for extracted cross-references

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0063 | A certifiable bridge for intermediate PreTeXt users

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0064 | A version-pinned audit of unfinished Guide signals

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0065 | An edge-complete certificate for type-specific quick starts

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0066 | Witnessed discovery for PreTeXt samples

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0067 | Residual-context certificates for PreTeXt snippets

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0068 | Closure-certified copyable PreTeXt starters

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0069 | Certified LaTeX/Markdown import into PreTeXt

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0070 | Context-aware certified selection conversion

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0071 | A dependency-closed LaTeX subset for certified PreTeXt import

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0072 | Profile-scoped evidence for PreTeXt interactivity and accessibility

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0073 | A certified component-scaffolding contract for course syllabi and worksheets

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0074 | Hermetic modules for sharing PreTeXt policy and style

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0075 | A safe publication-first launch contract

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0076 | A release contract for private instructor publishing

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0077 | Collision-safe assembly of legacy worksheets

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0078 | A versioned capability contract for PreTeXt programming languages

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0079 | Task portability for heterogeneous embeddables

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0080 | A semantic degradation contract and state lower bound for EPUB knowl fallbacks

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0081 | Certifying offline PreTeXt slides on removable media

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0082 | Coherent publication of a course slide collection

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0083 | A deterministic contract for parallel Macaulay2 core routines

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0084 | Certified portfolios for a responsive Macaulay2 top level

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0085 | A degree-slice fast path for basis

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0086 | Certified degree windows for truncated algebra commands

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0087 | A versioned contract for reproducible Macaulay2 family benchmarks

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0088 | A localization-safe action of Weyl operators

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0092 | A fixed-basis semibasis certificate for DG-module interoperability

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0093 | Simplicial resolutions in Macaulay2 and a join-complete verification contract

Macaulay2 software feature request rather than a mathematical open problem

AIM-INFRASTRUCTURE-0094 | Truncation representatives, semantic equality certificates, and functorial cohomology maps

Macaulay2 software data-type engineering question rather than a mathematical open problem

AIM-INFRASTRUCTURE-0096 | A consent-bounded two-channel and four-lane community response to harassment

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0097 | A gated equity-action registry for mathematics organizations

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0098 | A provenance-bounded design for the history of women in combinatorics

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0099 | Locally governed translation-before-transfer for non-US departmental equity conversations

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0100 | An event access assurance case for mathematics

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0101 | A mobility-and-care adjusted compensation and incidence framework

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0102 | A co-governed category-and-access charter beyond a single gender binary

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0103 | A choice-point audit for social framing in mathematical practice

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0104 | Breach-centered sampling of IBL classroom culture

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0105 | Identification and repair of an AB/BA proof-learning study

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-INFRASTRUCTURE-0106 | A causal design for long-term effects of Modified Moore Method instruction on baseline-strong students

Non-mathematical workshop administration / infrastructure / UI / pedagogy item

AIM-LOGIC-0026 | Questions 10--14 and a full quantifier collapse in literal dual covering

Multi-problem workshop PDF dump or non-problem placeholder

AIM-LOGIC-0078 | Unrecovered Jarden questions and a Galois-core decidability obstruction

Placeholder heading ('Question 18 (Jarden). Various questions from Jarden\'s talk.') with no mathematical problem statement.

AIM-LOGIC-0114 | Fermat's little theorem and a bounded modular-factorial code

Multi-problem workshop PDF dump or non-problem placeholder

AIM-LOGIC-0119 | What the Drinfeld commutator actually defines

Technical remark attached to Question 5 of Pheidas (AIM-LOGIC-0118), not a standalone problem.

AIM-LOGIC-0149 | A branch-profile audit of the CBH participant note

Participant bio/interest statement (Appendix A.1, David Aspero), not an open problem.

AIM-LOGIC-0150 | A forcing diagnostic for CH and Omega-logic

Participant bio/interest statement (Appendix A.2, Andrew Brooke-Taylor), not an open problem.

AIM-LOGIC-0151 | A parameter-exact sharp-to-perfect-set bridge

Participant bio/interest statement (Appendix A.3, Elizabeth Brown), not an open problem.

AIM-LOGIC-0153 | Games, distributivity, and stationarity preservation

Multi-problem workshop PDF dump or non-problem placeholder

AIM-LOGIC-0154 | From Jensen covering to a singular-cardinal obstruction

Participant bio/interest statement (Appendix A.6, Mirna Dzamonja), not an open problem.

AIM-LOGIC-0155 | A limit-gap obstruction for partial iteration strategies

Participant bio/interest statement (Appendix A.7, Gunter Fuchs), not an open problem.

AIM-LOGIC-0156 | The relativized Church-Kleene boundary as a fine-structure bridge

Participant bio/interest statement (Appendix A.8, Noam Greenberg), not an open problem.

AIM-LOGIC-0157 | An internal coding criterion for HOD to satisfy V = HOD

Participant bio/interest statement (Appendix A.9, Peter Koellner), not an open problem.

AIM-LOGIC-0158 | Local branch hypotheses as uniqueness and gluing principles for strategies

Participant bio/interest statement (Appendix A.10, Grigor Sargsyan), not an open problem.

AIM-LOGIC-0159 | A delegated problem list and a ZFC envelope for Theta of L(R)

Broken URL pointer in participant appendix (Appendix A.11, Ernest Schimmerling), not a self-contained problem.

AIM-LOGIC-0160 | A necessary HOD diagnostic inside determinacy models

Participant bio/interest statement (Appendix A.12, Yasuo Yoshinobu), not an open problem.

AIM-OTHER-0008 | Source-boundary repair and a quantitative resonance profile

Spliced discussion fragment following Problem 2.4 and section header 2.4, not a standalone problem.

AIM-OTHER-0068 | A spurious contents-page match and an entropy obstruction to strict local rigidity

Multi-problem workshop PDF dump or non-problem placeholder

AIM-OTHER-0071 | A section-boundary fragment and a periodic-data obstruction

Literature status fragment following Conjecture 2 (AIM-OTHER-0070), not a standalone problem.

AIM-OTHER-0073 | A truncated transitivity status sentence and a Fourier mixing criterion

Mid-sentence status fragment following Conjecture 3 (AIM-OTHER-0072), not a standalone problem.

AIM-OTHER-0074 | Context around Anosov classification: transitivity and smooth-conjugacy obstructions

Continuation of the status commentary on Conjecture 3 (AIM-OTHER-0072), not a standalone problem.

AIM-OTHER-0075 | Higher-rank conjugacy regularity: scope, obstruction, and a toral affine criterion

Mid-sentence continuation of the commentary on Conjecture 3 (AIM-OTHER-0072), not a standalone problem.

AIM-OTHER-0077 | Higher-rank rigidity context and a finite-phase circle normal form

Mid-sentence status fragment following Conjecture 4 (AIM-OTHER-0076), not a standalone problem.

AIM-OTHER-0079 | Open-dense classification and the equivariant blow-up obstruction

Mid-sentence status fragment following Conjecture 5 (AIM-OTHER-0078), not a standalone problem.

AIM-OTHER-0090 | Boundary fragment and rounding-sensitive Kronecker sampling

Mid-sentence status commentary following Question 15 (AIM-OTHER-0089), not a standalone problem.

AIM-OTHER-0093 | Exact certificates for Shah's rank-one curve condition

Explanatory paragraph describing N. Shah's partial result on Question 17 (AIM-OTHER-0092), not a standalone problem.

AIM-OTHER-0097 | A quantitative fixed-horocycle bridge to the critical simultaneous limit

Introductory setup paragraph between Conjecture 20 and Conjecture 21 (AIM-OTHER-0098), not a standalone problem.

AIM-OTHER-0099 | The critical exponent is a quantifier boundary, not a new conjecture

Mid-sentence status fragment between Conjecture 21 and Conjecture 22, not a standalone problem.

AIM-OTHER-0100 | Source-boundary recovery and a fast/slow suspension model

Spliced status fragment between Conjecture 21 and Section 5.1, not a standalone problem.

AIM-OTHER-0104 | Entropy and no escape as a convergence criterion

Mid-sentence commentary fragment following Question 24 (AIM-OTHER-0103), not a standalone problem.

AIM-OTHER-0105 | Status fragment for equidistribution of compact flats

Mid-sentence status fragment following Question 24 (AIM-OTHER-0103), not a standalone problem.

AIM-OTHER-0106 | A quantitative Borel-Cantelli estimate for VWA matrices

Mid-sentence status fragment following Question 24 (AIM-OTHER-0103), not a standalone problem.

AIM-OTHER-0110 | Bridge from Question 27 to Littlewood's conjecture

Single transition sentence ('Question 27 is related to the well-known conjecture of Littlewood:') before Conjecture 28, not a standalone problem.

AIM-OTHER-0112 | The exact logical consequence of the EKL Littlewood exceptional-set theorem

Mid-sentence status fragment on Conjecture 28 (AIM-OTHER-0111), not a standalone problem.

AIM-OTHER-0113 | The Cassels-Swinnerton-Dyer bridge from Margulis to Littlewood

Single transition sentence ('Conjecture 28 is implied by the following conjecture:') before Conjecture 29, not a standalone problem.

AIM-OTHER-0115 | Logical separation of the neighboring Margulis conjectures

Background/transition paragraph between Conjecture 29 and Question 30, not a standalone problem.

AIM-OTHER-0117 | Auditing the compact-orbit/Markov-tail bridge

Single transition sentence ('Question 30 is equivalent to the following question:') before Question 31, not a standalone problem.

AIM-OTHER-0119 | The all-weights strategy for Littlewood's conjecture

Transition fragment between Conjecture 31 and Conjecture 32, not a standalone problem.

AIM-OTHER-0121 | A transition from weighted approximation to diagonal flows

Single transition sentence ('Conjecture 32 is related to the following conjecture: OPEN PROBLEMS 14') before Conjecture 33, not a standalone problem.

AIM-OTHER-0123 | The weighted-cone and opposite-Weyl-chamber cases of Conjecture 33

Incomplete sentence fragment following Conjecture 33 (AIM-OTHER-0122), not a standalone problem.

AIM-OTHER-0124 | A continuation fragment about opposite Weyl chambers and full dimension

Mid-sentence fragment following Conjecture 33 (AIM-OTHER-0122), not a standalone problem.

AIM-OTHER-0125 | Full dimension for the lattice solutions of Conjecture 33

Spliced sentence ending and section setup before Conjecture 34 (AIM-OTHER-0126), not a standalone problem.

AIM-OTHER-0127 | Progression lifting gives a four-dimensional shrinking-gap family

Status commentary fragment following Conjecture 34 (AIM-OTHER-0126), not a standalone problem.

AIM-OTHER-0130 | Non-isolation of the second inhomogeneous minimum

Status commentary and transition sentence between Conjecture 36 and Question 37, not a standalone problem.

AIM-OTHER-0134 | Watson's conditional rate in arithmetic quantum unique ergodicity

Mid-sentence status fragment on Conjecture 39 (AIM-OTHER-0133), not a standalone problem.

AIM-OTHER-0135 | A height-moment criterion for recovering escaped arithmetic quantum mass

Mid-sentence status fragment on Conjecture 39 (AIM-OTHER-0133), not a standalone problem.

AIM-OTHER-0137 | Projective normalization for continuous-spectrum quantum measures

Mid-sentence status fragment on Problem 40 (AIM-OTHER-0136), not a standalone problem.

AIM-OTHER-0138 | Higher-rank arithmetic QUE and a product-joining obstruction

Spliced status sentence on Conjecture 39 and setup paragraph for Conjecture 41, not a standalone problem.

AIM-OTHER-0140 | Evidence sentence and a correlation obstruction to rate CLTs

Mid-sentence transition fragment between Conjecture 41 and Conjecture 42, not a standalone problem.

AIM-OTHER-0141 | Semiclassical setup and commutator-coboundary invariance

Setup definitions fragment preceding Conjecture 42 (AIM-OTHER-0142), not a standalone problem.

AIM-OTHER-0146 | Coarea normalization for the Question 45 continuation

Mid-sentence continuation fragment between Question 45 and Conjecture 46, not a standalone problem.

AIM-OTHER-0147 | Shared-anchor obstructions for a two-gap quadratic-form fragment

Five-word boundary fragment ('Conjecture 45 is dense in R2.7. Polygonal billiards'), not a standalone problem.

AIM-OTHER-0151 | A split status sentence for Weiss's divergent-orbit conjecture

Incomplete status sentence fragment following Conjecture 48 (AIM-OTHER-0150), not a standalone problem.

AIM-OTHER-0152 | The one-parameter and full-torus status cases of Conjecture 48

Mid-sentence status fragment following Conjecture 48 (AIM-OTHER-0150), not a standalone problem.

AIM-OTHER-0153 | The general rational-rank obstruction and a finite-isogeny audit

Mid-sentence status fragment following Conjecture 48 (AIM-OTHER-0150), not a standalone problem.

AIM-OTHER-0154 | The former exceptional diagonal subgroup in SL_4

Status commentary and transition paragraph between Conjecture 48 and Question 49, not a standalone problem.

AIM-OTHER-0158 | The GRH curve theorem and a Hecke-correlated CM conductor ray

Single status sentence on Conjecture 51 (AIM-OTHER-0157), not a standalone problem.

AIM-OTHER-0159 | Equidistribution as a route to special closure

Explanatory motivation fragment following Conjecture 51 (AIM-OTHER-0157), not a standalone problem.

AIM-OTHER-0161 | Duke packets, conductors, and stable discriminant windows

Truncated or non-self-contained workshop heading/fragment

AIM-OTHER-0164 | Dimension correction and unconditional arithmeticity bridge

Truncated or non-self-contained workshop heading/fragment

AIM-OTHER-0165 | Dimension and normalization of eligible horospherical lattices

Mid-sentence setup fragment preceding Question 54 (AIM-OTHER-0166), not a standalone problem.

AIM-PDES-0005 | Exact SQG sector and sharp interior-PV boundary drift

Truncated or non-self-contained workshop heading/fragment

AIM-PDES-0022 | Landau equation: context recovery and a structure-preserving kernel audit

Truncated or non-self-contained workshop heading/fragment

AIM-PDES-0023 | A virial clock for homogeneous aggregation-diffusion

Truncated or non-self-contained workshop heading/fragment

AIM-PDES-0024 | Applied Models heading recovery and a gang-model spectral benchmark

Truncated or non-self-contained workshop heading/fragment

AIM-PDES-0066 | Branch-aware well balancing and a resonance obstruction for oscillatory forcing

Participant research-interest statement (Appendix A.1, Debora Amadori), not a standalone open problem.

AIM-PDES-0067 | A viscous duality benchmark for particle methods with point sources

Participant research-interest statement (Appendix A.2, Alina Chertock), not a standalone open problem.

AIM-PDES-0068 | Uniform-time matrix-viscosity estimates at a fully damped equilibrium

Participant research-interest statement (Appendix A.3, Cleopatra Christoforou), not a standalone open problem.

AIM-PDES-0069 | Energy/AP audit and a kinetic-cone counterexample for a stiff two-moment model

Participant research-interest statement (Appendix A.4, Bruno Després), not a standalone open problem.

AIM-PDES-0070 | Well-balanced reconstruction for hyperbolic chemotaxis

Contributed-talk abstract (Appendix A.5, Francis Filbet), not an open problem.

AIM-PDES-0071 | A smooth moment-realizability obstruction for non-Gaussian kinetic closures

Participant research statement (A.6 Irene Gamba) in Stiff Sources and Numerical Methods for Conservation Laws, not a standalone open problem

AIM-PDES-0072 | A mass-drift certificate for spherical shallow-water patch coupling

Participant research-interest statement (Appendix A.7, Anne Gelb), not a standalone open problem.

AIM-PDES-0073 | A commutator and equilibrium-projection obstruction for stiff splitting

Participant research-interest statement (Appendix A.8, Margot Gerritsen and Rami Younis), not a standalone open problem.

AIM-PDES-0074 | Exact interface balance and a raw-density current diagnostic for semiconductor drift-diffusion

Participant research-interest statement (Appendix A.9, Cory Hauck), not a standalone open problem.

AIM-PDES-0075 | Flux-conservative Liouville scattering at a potential step

Participant research-interest statement (Appendix A.10, Shi Jin), not a standalone open problem.

AIM-PDES-0076 | A boundary-work concentration diagnostic for shear-band blow-up

Participant research-interest statement (Appendix A.11, Theodoros Katsaounis), not a standalone open problem.

AIM-PHYSICS-0006 | Completeness status and the singular small-exponent limit

Multi-page workshop dump spanning contributions from five participants rather than a single problem statement.

AIM-PHYSICS-0010 | A one-coupling J-Schur certificate for projected spectral enclosures

Exact duplicate of AIM-ANALYTIC_NUMBER_THEORY-0077 (same AIM workshop list extracted under two subjects)

AIM-ANALYTIC_NUMBER_THEORY-0077 / p.145

AIM-PHYSICS-0011 | When holomorphic anomaly equations survive fiber integration

Exact duplicate of AIM-ANALYTIC_NUMBER_THEORY-0078 (same AIM workshop list extracted under two subjects)

AIM-ANALYTIC_NUMBER_THEORY-0078 / p.137

AIM-PHYSICS-0012 | Differential fingerprints of eta-products

Exact duplicate of AIM-ANALYTIC_NUMBER_THEORY-0079 (same AIM workshop list extracted under two subjects)

AIM-ANALYTIC_NUMBER_THEORY-0079 / p.54

AIM-PHYSICS-0013 | Holomorphic anomaly, fibrations, and the BPS multiple-cover transform

Exact duplicate of AIM-ANALYTIC_NUMBER_THEORY-0080 (same AIM workshop list extracted under two subjects)

AIM-ANALYTIC_NUMBER_THEORY-0080 / p.120

AIM-PHYSICS-0014 | Compact-fixed-locus definitions and pole obstructions for noncompact elliptic genera

Exact duplicate of AIM-ANALYTIC_NUMBER_THEORY-0081 (same AIM workshop list extracted under two subjects)

AIM-ANALYTIC_NUMBER_THEORY-0081 / p.19

AIM-PHYSICS-0015 | A normal-symbol criterion for lower-dimensional modular reduction

Exact duplicate of AIM-ANALYTIC_NUMBER_THEORY-0082 (same AIM workshop list extracted under two subjects)

AIM-ANALYTIC_NUMBER_THEORY-0082 / p.17

AIM-PHYSICS-0016 | Coefficientwise indices and a level-two Calabi--Yau/CFT test

Exact duplicate of AIM-ANALYTIC_NUMBER_THEORY-0083 (same AIM workshop list extracted under two subjects)

AIM-ANALYTIC_NUMBER_THEORY-0083 / p.40

AIM-PHYSICS-0017 | Paramodular consistency tests for Calabi-Yau counting series

Exact duplicate of AIM-ANALYTIC_NUMBER_THEORY-0084 (same AIM workshop list extracted under two subjects)

AIM-ANALYTIC_NUMBER_THEORY-0084 / p.173

AIM-PHYSICS-0018 | Normalization-aware leading quintic amplitudes at the Gepner point

Exact duplicate of AIM-ANALYTIC_NUMBER_THEORY-0085 (same AIM workshop list extracted under two subjects)

AIM-ANALYTIC_NUMBER_THEORY-0085 / p.162

AIM-PHYSICS-0019 | Hurwitz class numbers, CM enumeration, and local conductor layers

Exact duplicate of AIM-ANALYTIC_NUMBER_THEORY-0086 (same AIM workshop list extracted under two subjects)

AIM-ANALYTIC_NUMBER_THEORY-0086 / p.134

AIM-PHYSICS-0020 | Formal, Jacobi, and wave-function transformations of the string coupling

Exact duplicate of AIM-ANALYTIC_NUMBER_THEORY-0087 (same AIM workshop list extracted under two subjects)

AIM-ANALYTIC_NUMBER_THEORY-0087 / p.50

AIM-PHYSICS-0021 | Mirror-quintic periods, modular-type structures, and a conifold obstruction

Exact duplicate of AIM-ANALYTIC_NUMBER_THEORY-0088 (same AIM workshop list extracted under two subjects)

AIM-ANALYTIC_NUMBER_THEORY-0088 / p.149

AIM-PHYSICS-0022 | Functional equations and an Euler-product obstruction for mixed mock L-series

Exact duplicate of AIM-ANALYTIC_NUMBER_THEORY-0089 (same AIM workshop list extracted under two subjects)

AIM-ANALYTIC_NUMBER_THEORY-0089 / p.178

AIM-PHYSICS-0023 | Hauptmodul differential equations for an even-weight mixed-mock class

Exact duplicate of AIM-ANALYTIC_NUMBER_THEORY-0090 (same AIM workshop list extracted under two subjects)

AIM-ANALYTIC_NUMBER_THEORY-0090 / p.22

AIM-PHYSICS-0024 | Mock modularity, geometric invariants, and finite pole tomography

Exact duplicate of AIM-ANALYTIC_NUMBER_THEORY-0091 (same AIM workshop list extracted under two subjects)

AIM-ANALYTIC_NUMBER_THEORY-0091 / p.150

AIM-PHYSICS-0028 | Rellich compactness and spectrum on open manifolds

Recorded answer/commentary fragment attached to the preceding L^2-harmonic forms question, not a standalone problem.

AIM-PHYSICS-0029 | Melrose's answer, compact Sobolev embedding, and escape of mass

Corrupted answer/boundary fragment ('3. (Melrose) There is no good general answer.'), not a standalone problem.

AIM-PROBABILITY-0080 | Eden conventions, exponential FPP clocks, and an exact finite-cluster comparison

Truncated or non-self-contained workshop heading/fragment

AIM-PROBABILITY-0140 | A recovered Coxeter-Catalan context fragment and a parabolic face bridge

Mid-sentence literature commentary fragment split from Problem 3.2 (AIM-PROBABILITY-0139), not a standalone problem.

AIM-PROBABILITY-0144 | A split source fragment and the dihedral noncrystallographic H-triangle

Mid-sentence continuation fragment split from Problem 1.2 (AIM-PROBABILITY-0143), not a standalone problem.

AIM-PROBABILITY-0146 | Fuss-nonnesting orders, a rank-one obstruction, and a Boolean q-model

Mid-sentence commentary fragment split from Problem 1.3 (AIM-PROBABILITY-0145), not a standalone problem.

AIM-PROBABILITY-0147 | An extraction boundary and stable edge coefficients

Four-word section boundary artifact ('Problem 2.1 below. 2. Enumerative Combinatorics'), not a problem.

AIM-PROBABILITY-0149 | Diagonal coinvariants beyond type A and an explicit Boolean model

Truncated ten-word prefix of Problem 2.2 (whose body is in AIM-PROBABILITY-0150), not a standalone problem.

AIM-PROBABILITY-0167 | Flag and homology obstructions to a polytopal skeleton realization

Mid-sentence status fragment split from Problem 6.3 (AIM-PROBABILITY-0166), not a standalone problem.

AIM-PROBABILITY-0168 | Higher Cohen-Macaulay connectivity of generalized cluster complexes

Truncated or non-self-contained workshop heading/fragment

AIM-REPRESENTATION_THEORY-0071 | Lurie's twisted Whittaker conjecture: status and a torus formulation test

Unrecoverable AIM statement:

AIM-TOPOLOGY-0174 | Royden motivation for Thurston-norm rigidity: source recovery and a globalization reduction

Introductory motivation fragment split from Problem 1.1 (AIM-TOPOLOGY-0173), not a standalone problem.

AIM-TOPOLOGY-0204 | Critical-exponent exhaustions and the ergodic endpoint

Commentary remark attached to Problem 4.3 (AIM-TOPOLOGY-0203), not a standalone problem.

AIM-TOPOLOGY-0211 | Monday section aggregate and the overtwisted absorber principle

Multi-problem workshop PDF dump or non-problem placeholder

AIM-TOPOLOGY-0212 | Tuesday problem-session bundle and primitive height in a symplectization

Multi-problem workshop PDF dump or non-problem placeholder

AIM-TOPOLOGY-0213 | Friday contact-topology session and Hofer-large commutators

Multi-problem workshop PDF dump or non-problem placeholder

OWR-10252925-006 | Białynicki-Birula Cell Construction

Unrecoverable OWR statement (The official report passage contains definitions and a proved construction but no open mathematical claim.)

OWR-10252926-001 | Unspecified Geometric Representation Theory Conjecture

Unrecoverable OWR statement (The official report shows that this is a table-of-contents fragment without a recoverable standalone conjecture. No separate clean statement)

OWR-10252928-001 | Unspecified Conic Optimization Research Problem

Unrecoverable OWR statement (The official report shows that this is workshop-level introductory prose rather than a standalone conic-optimization problem. No separate cl)

OWR-10252928-003 | Unspecified Flag Algebra Extremal Problem

Unrecoverable OWR statement (The official report gives a descriptive account of flag-algebra methods but does not formulate a standalone open extremal problem. No separa)

OWR-10252929-001 | Zilber-Pink Unlikely Intersection Conjecture

Duplicate/merged OWR extraction (The official report contains only workshop-level context mentioning the Zilber-Pink conjecture; the complete modular formulation is retained)

OWR-10252929-008 / p.756

OWR-10252930-002 | Talagrand's Conjecture on Selector Processes

Answered in the source or not an open problem (solved (a title line, not a question))

OWR-10252930-010 | Ryser-Brualdi-Stein Transversal Conjecture

Duplicate/merged OWR extraction (The official report states the Ryser-Brualdi-Stein conjecture, but the identical conjecture is already represented by the earlier canonical)

OWR-16763-027 / p.1729

OWR-10252931-002 | Partial Fermionization of Cohomological Hall Algebras

Duplicate/merged OWR extraction (The official report confirms that this is a duplicate extraction of the quiver-with-potential formulation already retained in OWR-10252931-0)

OWR-10252931-001 / p.238

OWR-10252932-001 | Open Problems in K-Theory of Ring Pushouts

Unrecoverable OWR statement (The official source passage is a table-of-contents fragment ending in the word conjecture and contains no recoverable claim. No separate cle)

OWR-10252932-004 | Comparison Maps in p-Adic Cohomology

Unrecoverable OWR statement (The official source passage is a damaged splice between a conjectural comparison-map fragment and a proved theorem, so it does not identify)

OWR-10252932-008 | Hopkins-Morel Input to Motivic Stable Homotopy

Unrecoverable OWR statement (The official source passage explains that a proved main theorem follows from the Hopkins-Morel conjecture; it is not a separate unresolved p)

OWR-10252935-003 | Foundations of Stochastic Quantization

Unrecoverable OWR statement (The phrase is the title of an expository contribution that compares established constructions of stochastic quantization, not a standalone o)

OWR-10252936-001 | Definition and Scope of Stochastic Quantization

Unrecoverable OWR statement (The official report uses this phrase as the rhetorical title of an expository discussion and does not formulate a single mathematical questi)

OWR-1052-001 | Weinstein Conjecture for Contact-Type Energy Hypersurfaces

Duplicate of canonical problem DYN-001

DYN-001 / p.1613

OWR-1052-003 | Harmonic One-Forms in Perturbed Pseudoholomorphic-Curve Equations

Answered in the source or not an open problem (solved (answered in the source))

OWR-1053-008 | Birch-Swinnerton-Dyer Conjecture

Duplicate of canonical problem MPP-005

MPP-005 / p.35

OWR-1054-002 | Hausdorff Dimension of Singular Sets for Variational Minimizers

Answered in the source or not an open problem (solved (yes; answered in the source))

OWR-1062-010 | Lower Semicontinuity of Free Entropy Dimension

Answered in the source or not an open problem (solved (no; answered in the source))

OWR-1063-003 | Rhetorical Primitive-Central Cohomology Question

Unrecoverable OWR statement (The extracted record converts a rhetorical transition into an open problem, but the official abstract immediately answers it with structural)

OWR-1106-006 | Duplicate: Finiteness of Degree-One Three-Manifold Targets

Duplicate/merged OWR extraction (The official Oberwolfach report was checked directly. This extraction repeats the same source problem as OWR-1106-005 and contains no indepe)

OWR-1106-005 / p.1057

OWR-1106-007 | Duplicate: Finiteness of Degree-One Three-Manifold Targets

Duplicate/merged OWR extraction (The official Oberwolfach report was checked directly. This extraction repeats the same source problem as OWR-1106-005 and contains no indepe)

OWR-1106-005 / p.1057

OWR-1108-001 | Statistical Model Selection and Prediction Targets

Terminological discussion prompt on the meaning of the phrase 'model selection' rather than a mathematical research problem

OWR-11101913-003 | Known Cases of Iitaka Subadditivity

Duplicate/merged OWR extraction (The official report confirms that this passage lists established cases of Iitaka subadditivity and does not pose a separate open problem; th)

OWR-11101913-002 / p.691

OWR-11101913-004 | Methods for Kodaira-Dimension Superadditivity

Unrecoverable OWR statement (The official report confirms that this extraction is commentary on methods and known cases rather than a self-contained open problem. No sep)

OWR-11101916-003 | Unspecified Assembly Map Comparison Conjecture

Unrecoverable OWR statement (The extraction combines introductory assembly-map discussion and definitions without stating a standalone unresolved target. No separate cle)

OWR-11101916-006 | Field-Theoretic Description of the Full Spectral Action

Unrecoverable OWR statement (The contribution asks this question rhetorically and then answers it with its main spectral-action expansion theorem. No separate clean stat)

OWR-11101916-008 | Surjectivity in Algebraic K-Theory of Varieties

Answered in the source or not an open problem (partially_solved (no, for finite fields of odd characteristic; answered in the source))

OWR-11101916-010 | Generalized Group Actions for Crossed-Product Operator Algebras

Unrecoverable OWR statement (The contribution immediately answers its motivating question by identifying Fell bundles as the appropriate generalized actions. No separate)

OWR-11101917-001 | Connes-Embedding Table-of-Contents Fragment

Unrecoverable OWR statement (The official report confirms that the extraction is a table-of-contents fragment, not a standalone open mathematical problem.)

OWR-11101917-013 | Resolved Coarseness Conjecture for Free Group Factors

Unrecoverable OWR statement (The official report states that the coarseness conjecture under discussion was resolved positively; the extracted passage is not an open pro)

OWR-11101918-001 | Workshop Summary on Geometric Measure Theory and Flows

Unrecoverable OWR statement (The official report confirms that the extraction is workshop-summary prose and a list of topics, not a standalone mathematical problem. No s)

OWR-11101918-002 | Workshop Contents Listing for Geometric Variational Analysis

Unrecoverable OWR statement (The official report confirms that the extraction is a table-of-contents fragment, not a mathematical problem. No separate clean statement is)

OWR-11101918-003 | Classical Limit of Nonlocal Minimal Surfaces

Unrecoverable OWR statement (The official report raises this question only as a lead-in and immediately states that it is answered by the reported work, so it is not pre)

OWR-11101919-001 | Unspecified Three-Dimensional Shape Analysis Problem

Unrecoverable OWR statement (The official report gives only broad workshop context about three-dimensional shape analysis and states no standalone mathematical target. N)

OWR-11101924-001 | High-Frequency Helmholtz Green-Function Separability

Unrecoverable OWR statement (The official report presents separability bounds answering this rhetorical title and does not isolate an unresolved mathematical claim.)

OWR-11101924-002 | Phase-Space Quantization for Variable-Coefficient PDEs

Unrecoverable OWR statement (The official report immediately answers this question by a semiclassical Fourier-integral-operator construction, so it is not an open proble)

OWR-11101924-005 | Resolved Helmholtz Degrees-of-Freedom Question

Unrecoverable OWR statement (The official report answers the degrees-of-freedom question and develops its extension; the extraction does not retain an open problem.)

OWR-11101924-007 | Diffractive High-Frequency Wave Propagation

Unrecoverable OWR statement (The official report treats this heading through sharp results and counterexamples rather than stating an unresolved mathematical problem.)

OWR-11126-004 | Invariant Measures for Thermostated Mechanical Systems

Unrecoverable OWR statement (The official report states affirmative results for the invariant-measure, uniqueness, convergence, and rate questions in the thermostated sy)

OWR-11126-006 | Frequency Maps of Central N-Body Equilibria

Duplicate/merged OWR extraction (This is a less precise repeated extraction of the frequency-image conjecture preserved in OWR-11126-005. No separate clean statement is prom)

OWR-11126-005 / p.1548

OWR-11126-007 | Reeb Orbits Bounding Global Disk Sections

Answered in the source or not an open problem (solved (for non-degenerate contact forms; answered in the source))

OWR-11126-010 | Rigidity of Maximal Rank Abelian Actions

Unrecoverable OWR statement (The official report introduces these rigidity questions and then immediately states a theorem resolving them in the setting considered. No s)

OWR-11127-022 | Duplicate Schur σ-Group Frequency Heuristic

Duplicate/merged OWR extraction (This record exactly repeats the same-report conjecture represented canonically by OWR-11127-021, with no distinct hypothesis or conclusion.)

OWR-11127-021 / p.176

OWR-11128-010 | Higher-Dimensional Riesz Transforms and Uniform Rectifiability

Duplicate/merged OWR extraction (This is a narrower repeated extraction of the David-Semmes Riesz-transform problem preserved in OWR-11128-002. No separate clean statement i)

OWR-11128-002 / p.1447

OWR-11132-003 | Stochastic Averaging with Topologically Complex Fast Orbits

Unrecoverable OWR statement (The wording is an expository transition to examples whose behavior is then analyzed in the contribution, not a standalone open problem. No s)

OWR-11133-004 | Realizability of Divisor Volumes

Answered in the source or not an open problem (solved (no; answered in the source))

OWR-11134-003 | Answered Characterization of Lookback Adjusters

Unrecoverable OWR statement (The source asks which trading guarantees are possible and immediately gives necessary-and-sufficient characterizations in Theorems 4 and 5.)

OWR-11136-011 | Lower Bounds for Higher-Dimensional Permutation Counts

Duplicate/merged OWR extraction (This repeats the asymptotic enumeration conjecture preserved in OWR-11136-010 and also corrupts its exponential factor. No separate clean st)

OWR-11136-010 / p.1639

OWR-11138-003 | Koszul Decompositions in Homotopy Theory

Unrecoverable OWR statement (The official report presents the Koszul property as an established result and then explains its meaning rather than posing an unresolved pro)

OWR-1115-003 | Redundant Extraction - Active Robin Boundaries

Duplicate/merged OWR extraction (The primary Oberwolfach report was checked directly and confirms that this extraction repeats OWR-1115-002 with the same domain, harmonic Ro)

OWR-1115-002 / p.1318

OWR-1116-010 | Polychromatic Subsets for Bounded Colorings of the First Uncountable Ordinal

Answered in the source or not an open problem (solved (independent of ZFC; answered in the source))

OWR-1116-011 | Ground Axiom Consequences for Cardinal Arithmetic

Answered in the source or not an open problem (solved (no; answered in the source))

OWR-11446-001 | Simultaneous Exact Tests for Contingency Tables

Unrecoverable OWR statement (The phrase was extracted from a contribution title and abstract that present methods and results, not a standalone open conjecture. No separ)

OWR-11451-005 | Composite Repetition of Three Matroid Questions

Unrecoverable OWR statement (The official report contains three separate questions, but this extraction conflates all three and repeats the first two records in this chu)

OWR-11451-013 | Unique Games Conjecture

Duplicate of canonical problem CS-001

CS-001 / p.2109

OWR-11571-001 | Recovering Tacit Mathematical Skills from Historical Sources

Unrecoverable OWR statement (The official history-of-mathematics workshop report treats this as a historical, pedagogical, or methodological discussion prompt rather tha)

OWR-11571-002 | Tacit and Explicit Knowledge in Mathematical Practice

Unrecoverable OWR statement (The official history-of-mathematics workshop report treats this as a historical, pedagogical, or methodological discussion prompt rather tha)

OWR-11571-003 | Tacit Knowledge in Mathematical History

Unrecoverable OWR statement (The official history-of-mathematics workshop report treats this as a historical, pedagogical, or methodological discussion prompt rather tha)

OWR-11571-004 | Explicit and Tacit Knowledge in Mathematical Instruments

Unrecoverable OWR statement (The official history-of-mathematics workshop report treats this as a historical, pedagogical, or methodological discussion prompt rather tha)

OWR-11571-005 | Bicycle Mechanics and Tacit Mathematical Knowledge

Unrecoverable OWR statement (The official history-of-mathematics workshop report treats this as a historical, pedagogical, or methodological discussion prompt rather tha)

OWR-11571-006 | Modeling and Solving Bicycle Motion

Unrecoverable OWR statement (The official history-of-mathematics workshop report treats this as a historical, pedagogical, or methodological discussion prompt rather tha)

OWR-11571-007 | Interpreting Obscure Medieval Mathematical Algorithms

Unrecoverable OWR statement (The official history-of-mathematics workshop report treats this as a historical, pedagogical, or methodological discussion prompt rather tha)

OWR-11571-008 | Tacit Steps and Textual Corruption in Medieval Algorithms

Unrecoverable OWR statement (The official history-of-mathematics workshop report treats this as a historical, pedagogical, or methodological discussion prompt rather tha)

OWR-11571-009 | Omitted Steps in Historical Mathematical Algorithms

Unrecoverable OWR statement (The official history-of-mathematics workshop report treats this as a historical, pedagogical, or methodological discussion prompt rather tha)

OWR-11571-010 | Mathematical Signs and Model-Theoretic Semantics

Unrecoverable OWR statement (The official history-of-mathematics workshop report treats this as a historical, pedagogical, or methodological discussion prompt rather tha)

OWR-11571-011 | Practices of Nineteenth-Century Mathematical Education

Unrecoverable OWR statement (The official history-of-mathematics workshop report treats this as a historical, pedagogical, or methodological discussion prompt rather tha)

OWR-11571-012 | Mathematical Learning as Evidence of Tacit Knowledge

Unrecoverable OWR statement (The official history-of-mathematics workshop report treats this as a historical, pedagogical, or methodological discussion prompt rather tha)

OWR-11571-013 | Polanyi's Tacit Knowledge in Mathematical History

Unrecoverable OWR statement (The official history-of-mathematics workshop report treats this as a historical, pedagogical, or methodological discussion prompt rather tha)

OWR-11571-014 | Rigor and Antiformalism in Mathematics

Unrecoverable OWR statement (The official history-of-mathematics workshop report treats this as a historical, pedagogical, or methodological discussion prompt rather tha)

OWR-11571-015 | Tree Metaphors for Mathematical Development

Unrecoverable OWR statement (The official history-of-mathematics workshop report treats this as a historical, pedagogical, or methodological discussion prompt rather tha)

OWR-11571-017 | Logical Strength and Usefulness in Number Theory

Unrecoverable OWR statement (The official history-of-mathematics workshop report treats this as a historical, pedagogical, or methodological discussion prompt rather tha)

OWR-11573-001 | Equivalent-Dynamics Construction Report

Unrecoverable OWR statement (The official contribution introduces the desire for faster equivalent dynamics and then supplies the construction and results; the extracted)

OWR-11573-002 | Ballistic-Annihilation Scaling-Limit Report

Unrecoverable OWR statement (The official contribution presents the continuum-limit question as motivation and then derives the announced Boltzmann scaling result; the e)

OWR-11575-006 | Complexity of Maximal Chains in Computable Well-Partial-Orders

Answered in the source or not an open problem (solved (answered in the source))

OWR-11581-001 | Poisson Empirical-Bayes Estimator Report

Unrecoverable OWR statement (The official contribution states this estimator-construction goal and immediately develops the estimator and its asymptotic risk theorem, so)

OWR-11582-001 | Dense-Granular-Flow Results Report

Answered in the source or not an open problem (solved (answered in the source))

OWR-11695854-001 | Workshop Contents Listing for Quantum Geometry and Character Varieties

Unrecoverable OWR statement (The official report confirms that the extraction is a table-of-contents fragment, not a mathematical problem. No separate clean statement is)

OWR-11695858-001 | Invariance Principle for Reversible Random Conductance Walks

Unrecoverable OWR statement (The official report answers the extracted question with an invariance-principle theorem and does not leave it as an open problem.)

OWR-11695862-001 | O-Minimality Workshop Table-of-Contents Fragment

Unrecoverable OWR statement (The official report confirms that the extraction is a table-of-contents fragment, not a standalone open mathematical problem.)

OWR-11695862-012 | Duplicate Complex-Exponential Categoricity Formulation

Duplicate/merged OWR extraction (The official Oberwolfach report confirms that this extraction repeats the equivalent Schanuel and strong exponential-algebraic-closedness fo)

OWR-11695862-011 / p.2006

OWR-11695863-003 | Geometric Spectral Bounds for Infinite Quantum Graphs

Unrecoverable OWR statement (The official report poses a motivating question about geometric spectral estimates and then supplies the relevant theorem and corollary in t)

OWR-11695864-006 | Nonexistence of Geproci Sets in Linear General Position

Duplicate/merged OWR extraction (The official report confirms that this is a narrower duplicate of the geproci classification questions retained in OWR-11695864-001. No sepa)

OWR-11695864-001 / p.648

OWR-11695864-007 | Ten-Point Blowup Interpolation Consequences

Unrecoverable OWR statement (The extracted Pell-equation and vector-bundle passage reports established constructions and consequences but states no standalone open probl)

OWR-11695866-001 | Handwriting and Chronology in Veblen’s Notebooks

Unrecoverable OWR statement (The official report passage poses a historical and archival research inquiry about Veblen, not an open mathematical problem.)

OWR-11695866-002 | Authorship and Composition of Private Mathematical Manuscripts

Unrecoverable OWR statement (The official report passage concerns historical attribution and manuscript analysis, not an open mathematical problem.)

OWR-11695866-003 | Veblen’s Private Life and Archival Self-Presentation

Unrecoverable OWR statement (The official report passage concerns biographical and archival history, not an open mathematical problem.)

OWR-11695866-004 | Veblen’s Role in Princeton’s Institutional Rise

Unrecoverable OWR statement (The official report passage concerns institutional history, not an open mathematical problem.)

OWR-11695866-005 | Moore’s Laboratory Method in Veblen’s Geometry

Unrecoverable OWR statement (The official report passage concerns the history of mathematical practice and pedagogy, not an open mathematical problem.)

OWR-11780-004 | Nonspherical Orbit-Parameterization Report

Unrecoverable OWR statement (The official contribution introduces the nonspherical orbit question and then states its orbit-parameterization theorem, so the extraction t)

OWR-11784-009 | Conditional Sparse-Decomposition Theorem

Answered in the source or not an open problem (solved (a conditional theorem, not a problem))

OWR-11788-005 | Duplicate Quintic Resonant-System Scattering Problem

Duplicate/merged OWR extraction (This record exactly repeats the same-report resonant-system conjecture represented canonically by OWR-11788-004. No separate clean statement)

OWR-11788-004 / p.1492

OWR-11788-009 | Duplicate Three-Dimensional Navier-Stokes Problem

Duplicate/merged OWR extraction (This record restates the same-report three-dimensional Navier-Stokes global regularity and uniqueness problem represented canonically by OWR)

OWR-11788-002 / p.1477

OWR-11789-008 | Shrinking-Soliton Degeneration Report

Unrecoverable OWR statement (The official contribution uses a broad question about Gromov-Hausdorff limits as motivation and then states its compactness and singular-loc)

OWR-1183-007 | Duplicate Two-Dimensional Time-Bomb Conjecture

Duplicate/merged OWR extraction (This is a redundant extraction of OWR-1183-006 from the same statement of the Time-Bomb Conjecture in the official report. No separate clean)

OWR-1183-006 / p.1750

OWR-1183-012 | Duplicate Point-to-Hyperplane Matching Conjecture

Duplicate/merged OWR extraction (This is a redundant extraction of the matching-points-to-hyperplanes conjecture recorded canonically as OWR-1183-011. No separate clean stat)

OWR-1183-011 / p.1700

OWR-1186-002 | Answered Canonical-Momentum Balance Question

Answered in the source or not an open problem (solved (yes, with a qualification; answered in the source))

OWR-1186-003 | Answered Material-Momentum Terminology Question

Answered in the source or not an open problem (solved (yes; answered in the source))

OWR-1187-002 | Tilting Bundles of Line Bundles on Smooth Toric Varieties

Answered in the source or not an open problem (solved (no; answered in the source))

OWR-1188-013 | Duplicate: Bounded Local Solutions of Global Differential Modules

Duplicate/merged OWR extraction (The official Oberwolfach report was checked directly. This extraction repeats the same source problem as OWR-1188-012 and contains no indepe)

OWR-1188-012 / p.36

OWR-1190-001 | Realization of Algebraic Cones over Complete Intersections

Answered in the source or not an open problem (solved (yes; answered in the source))

OWR-1190-005 | Repeated Compact Lie-Group Algebraic-Model Conjecture

Duplicate/merged OWR extraction (The official report contains a single conjecture followed by its consequences; this extraction repeats its core equivalence and adds no inde)

OWR-1190-004 / p.1014

OWR-12005-010 | Duplicate Round-Sphere Eigenvalue Question

Unrecoverable OWR statement (The official report contains one round-sphere extremal question, and this extraction is textually identical in substance to the preceding re)

OWR-12006-003 | Derived Schläfli Formula for Spherical Cone Metrics

Answered in the source or not an open problem (solved (a completed calculation, not an open problem))

OWR-12007-013 | Answered Survey of Zero-Entropy Disk Dynamics

Duplicate/merged OWR extraction (The source uses this broad prompt to survey several notions of complexity, then records positive constructions for dense orbits, ergodicity,)

OWR-12007-014 / p.1573

OWR-12007-015 | Duplicate Mixing Zero-Entropy Disk Question

Duplicate/merged OWR extraction (This record exactly repeats the same-report mixing question represented canonically by OWR-12007-014. No separate clean statement is promote)

OWR-12007-014 / p.1573

OWR-12010-014 | Serre-Weight Modularity Theorem

Unrecoverable OWR statement (The official contribution states and proves the claimed modularity criterion under its hypotheses; the extraction strips those hypotheses an)

OWR-12014-005 | L-Space Conjecture

Duplicate of canonical problem KP-3.48

KP-3.48 / p.1104

OWR-12018-005 | Duplicate: HOMFLY Polynomials from Nested Hilbert Schemes

Duplicate/merged OWR extraction (Comparison with the official report and OWR-12018-003 confirms that this is a shortened repeat of the same ordinary HOMFLY conjecture. No se)

OWR-12018-003 / p.690

OWR-12018-007 | Duplicate: Homological Hilbert-Scheme Conjecture

Duplicate/merged OWR extraction (The official report presents this passage as verification context for the conjecture already recorded in OWR-12018-006, not as a separate pr)

OWR-12018-006 / p.690

OWR-12172-002 | Toric Orbits Meeting Subvariety Closures

Answered in the source or not an open problem (solved (answered in the source))

OWR-12173-007 | Duplicate: Sarnak's Möbius Disjointness Conjecture

Duplicate/merged OWR extraction (Comparison with the official report and OWR-12173-005 confirms that this is a second extraction of the same conjecture plus evidence about s)

OWR-12173-005 / p.1608

OWR-12175-002 | Duplicate: Toms-Winter Regularity Conjecture

Duplicate/merged OWR extraction (Comparison with the official report and OWR-12175-001 confirms that this is a restatement of the same three-way equivalence. No separate cle)

OWR-12175-001 / p.312

OWR-12175-006 | Duplicate: Kadison-Kastler Conjecture for C^*-Algebras

Duplicate/merged OWR extraction (Comparison with the official report and OWR-12175-005 confirms that this is a shortened repeat of the same conjecture. No separate clean sta)

OWR-12175-005 / p.256

OWR-12177-001 | Differential-Privacy Workshop Framing

Unrecoverable OWR statement (The official report uses this broad complexity prompt as workshop framing and supplies no determinate claim distinct from the concrete high-)

OWR-12177-005 | Useful Differential-Privacy Framing

Unrecoverable OWR statement (The official report uses this broad sentence as expository framing and does not pose it as a determinate problem separate from the explicit)

OWR-12177-006 | Private-Data-Analysis Framing

Unrecoverable OWR statement (The official contribution uses this broad prompt to motivate differential privacy and then narrows it to the concrete high-dimensional runni)

OWR-12177-009 | Unique Games Conjecture

Duplicate of canonical problem CS-001

CS-001 / p.2109

OWR-12177-011 | Machine-Learning Algorithms Results Report

Unrecoverable OWR statement (The official contribution asks rhetorically whether provable algorithms are possible and immediately answers yes by presenting three results)

OWR-12182-007 | Generalized Wills-Polynomial Results Report

Unrecoverable OWR statement (The official contribution introduces an interest in measure-independent root properties and then states the properties it proves; the extrac)

OWR-12182-008 | Geometric-Comparison Stability Framework

Unrecoverable OWR statement (The official contribution presents this generic inequality as a framework before applying it to specified geometric characteristics; without)

OWR-12182-009 | Geometric-Comparison Separation Framework

Unrecoverable OWR statement (The official contribution presents this generic separation inequality as the companion framework to its proved applications; the extraction)

OWR-12329-013 | Duplicate Minimal Ordered-Structure Question

Unrecoverable OWR statement (The official report contains one existence question beyond almost linearity, and this extraction duplicates the preceding canonical record f)

OWR-12330-013 | Counterexamples to Averaged Local Fractional-Coloring Bounds

Already answered in the original Oberwolfach workshop report (not an open problem)

OWR-12330-015 | Duplicate Weight-Modified Reed Coloring Question

Duplicate/merged OWR extraction (This record exactly repeats the same-report fractional-coloring question represented canonically by OWR-12330-014. No separate clean stateme)

OWR-12330-014 / p.1770

OWR-12331-003 | Sign-Definite Variational Formulations of Helmholtz Impedance Problems

Unrecoverable OWR statement (The official report asks for other sign-definite formulations and immediately supplies examples and a general transformation, so the extract)

OWR-12338-003 | Duplicate Einstein-Type Fluid-Dynamics Question

Duplicate/merged OWR extraction (The official report poses one question about deriving an Einstein-type law for localized fluid-mechanical objects and then cites concentrati)

OWR-12338-004 / p.1466

OWR-12340-001 | Historical Foundations of Mathematical Classification

Early-Modern Mixed Mathematics workshop report (16th-century historiography, not a mathematical research problem)

OWR-12340-002 | From Pure and Mixed to Pure and Applied Mathematics

Early-Modern Mixed Mathematics workshop report (16th-century historiography, not a mathematical research problem)

OWR-12340-003 | Mathematical Modelling as Scientific Knowledge Production

Early-Modern Mixed Mathematics workshop report (16th-century historiography, not a mathematical research problem)

OWR-12340-005 | Mathematics in Early-Modern Landscape Design

Early-Modern Mixed Mathematics workshop report (16th-century historiography, not a mathematical research problem)

OWR-12340-006 | Mixed Mathematics in Sixteenth-Century Practice

Early-Modern Mixed Mathematics workshop report (16th-century historiography, not a mathematical research problem)

OWR-12340-007 | Practice-Based Histories of Applied Mathematics

Early-Modern Mixed Mathematics workshop report (16th-century historiography, not a mathematical research problem)

OWR-12342-002 | Homogenization of Nonlinear Plasticity

Unrecoverable OWR statement (The official report immediately answers this explanatory question by identifying the nonlinear equations, differential inclusion, and insuff)

OWR-12487-001 | Expository Automorphic Spectral Decomposition

Unrecoverable OWR statement (The official report presents this as expository background and immediately gives the discrete-continuous decomposition, finite-multiplicity)

OWR-12487-002 | Expository Transition to Adelic Hecke Operators

Unrecoverable OWR statement (The source’s “What does one know?” is a rhetorical transition in an introductory account; the following paragraphs answer it by passing to t)

OWR-12493-006 | Duplicate: Valuative Form of Grothendieck's Section Conjecture

Duplicate/merged OWR extraction (Comparison with the official report and OWR-12493-007 confirms that this is another extraction of the same valuative section conjecture. No)

OWR-12493-007 / p.195

OWR-12495-002 | Secondary K-Theory Comparison Map

Unrecoverable OWR statement (Checked against the official Oberwolfach report. The extracted sentence states a construction and result proved in the source, rather than a)

OWR-12495-003 | Lefschetz Classes and the Tate and Hodge Conjectures

Unrecoverable OWR statement (Checked against the official Oberwolfach report. The extracted sentence is an explanatory sufficient-condition statement, not an open proble)

OWR-12495-005 | Tate and Hodge Classes on CM Abelian Varieties

Unrecoverable OWR statement (Checked against the official Oberwolfach report. The extraction paraphrases background already represented by the adjacent source questions)

OWR-12588-003 | Existence of Solutions to the Inverse σ_k Equation

Answered in the source or not an open problem (solved (answered in the source))

OWR-12592-005 | Duplicate Linear σ-Model Phase Equivalence

Duplicate/merged OWR extraction (The official report states one conjecture that the D-brane categories associated with the respective phases of the constructed nonabelian li)

OWR-12592-004 / p.656

OWR-12596-002 | Stationarity of a GARCH Recurrence

Unrecoverable OWR statement (Checked against the official Oberwolfach report. The source presents the implication as a standard explanatory step establishing stationarit)

OWR-1265-001 | Workshop-Scope List of Representation Conjectures

Unrecoverable OWR statement (The official report introduction only lists several conjectures as workshop themes; it does not state a distinct combined problem, and indiv)

OWR-1265-004 | McKay Conjecture for Finite Groups

Duplicate of canonical problem ALG-014

ALG-014 / p.268

OWR-1265-014 | Repeated Local Grothendieck-Group Conjecture

Duplicate/merged OWR extraction (The official report states one integral equivariant isomorphism conjecture; this extraction paraphrases the same conjecture preserved in OWR)

OWR-1265-015 / p.359

OWR-1265-016 | Repeated Local Grothendieck-Group Conjecture

Duplicate/merged OWR extraction (The official report states one integral equivariant isomorphism conjecture; this shortened label restates the same claim preserved in OWR-12)

OWR-1265-015 / p.359

OWR-1265-024 | Answered Shortest-Route Enumeration

Already answered in the original Oberwolfach workshop report (not an open problem)

OWR-1269-007 | Duplicate: Weak Uniqueness of Elementary-Embedding Square Roots

Duplicate/merged OWR extraction (The official Oberwolfach report was checked directly. This extraction repeats the same source problem as OWR-1269-006 and restates only part)

OWR-1269-006 / p.1996

OWR-1269-008 | Duplicate: Weak Uniqueness of Elementary-Embedding Square Roots

Duplicate/merged OWR extraction (The official Oberwolfach report was checked directly. This extraction repeats the same source problem as OWR-1269-006 and restates only part)

OWR-1269-006 / p.1996

OWR-1269-009 | Duplicate: Weak Uniqueness of Elementary-Embedding Square Roots

Duplicate/merged OWR extraction (The official Oberwolfach report was checked directly. This extraction repeats the same source problem as OWR-1269-006 and restates the same)

OWR-1269-006 / p.1996

OWR-12697684-001 | Ryser-Brualdi-Stein Latin Square Transversal Conjecture

Duplicate/merged OWR extraction (The extraction is workshop context for the Ryser-Brualdi-Stein conjecture, whose complete formulation is retained in OWR-12697684-020. No se)

OWR-12697684-020 / p.1729

OWR-12697684-002 | Unspecified Extremal Combinatorics Conjecture

Unrecoverable OWR statement (The official report shows that this is an incomplete table-of-contents fragment without a mathematical statement. No separate clean statemen)

OWR-12697684-003 | Unspecified Random Function Root Problem

Duplicate/merged OWR extraction (The extraction is only the title of a contribution; its specific random-root questions are retained in OWR-12697684-016 and OWR-12697684-017)

OWR-12697684-016 / p.1946 OWR-12697684-017 / p.1909

OWR-12697684-012 | Repeated Erdős-Hajnal Conjecture Context

Duplicate/merged OWR extraction (The official report confirms that this is contextual repetition of the Erdős-Hajnal conjecture retained in OWR-12697684-011. No separate cle)

OWR-12697684-011 / p.1815

OWR-12697686-001 | Workshop Contents Listing for Low-Dimensional Topology

Unrecoverable OWR statement (The official report confirms that the extraction is a table-of-contents fragment, not a mathematical problem. No separate clean statement is)

OWR-12697686-004 | Background on Circle Actions and the L-Space Conjecture

Unrecoverable OWR statement (The official report confirms that the extraction is introductory exposition rather than a standalone problem; the adjacent records represent)

OWR-12697686-013 | Slice-Ribbon Conjecture

Duplicate of canonical problem TOP-004

TOP-004 / p.1248

OWR-12697686-014 | Background on Cable Sliceness and Genus Bounds

Unrecoverable OWR statement (The official report confirms that the extraction is explanatory prose surrounding a proved argument, not a separately stated open problem. N)

OWR-12697686-017 | Incomplete Slice-Missing-Slice-Disc Lead-In

Unrecoverable OWR statement (The official report confirms that this extraction is the first half of a figure-dependent problem and is not independently self-contained. N)

OWR-12697686-018 | Figure-Dependent Slice Curves in Disc Complements

Unrecoverable OWR statement (The official report confirms that the knot and the curves in this question are defined only by a figure absent from the dataset, so a self-c)

OWR-12697687-007 | Homeomorphism Classification of Compact Oriented Four-Manifolds

Unrecoverable OWR statement (The extracted sentence is an expository heading that is immediately followed by the modified-surgery strategy; it is not posed as a standalo)

OWR-12697688-007 | Central Leaves Under Prime-to-p Hecke Correspondences

Unrecoverable OWR statement (The official report passage states a proved theorem on the stability of central leaves under Hecke correspondences, not an open problem.)

OWR-12697688-009 | Local Nonvanishing in Arithmetic Gan-Gross-Prasad Theory

Unrecoverable OWR statement (The official report gives a local nonvanishing fact and then states proved cases; the passage does not formulate an unresolved problem.)

OWR-12697688-011 | Langlands-Rapoport Conjecture for Parahoric Level

Unrecoverable OWR statement (The official report explicitly says that the conjecture discussed in this extraction has been proved, so it is not an open problem.)

OWR-12697688-019 | Fargues Eigensheaf Construction Context

Unrecoverable OWR statement (The official report confirms that this extraction is contextual setup duplicated by the following complete open problem.)

OWR-12697688-021 | Naive Local-Global Compatibility Formulation

Unrecoverable OWR statement (The official report presents this naive formulation only as exposition before a conditional theorem; the extraction does not preserve a stan)

OWR-12697688-022 | Local-Model Description of Shimura Varieties

Unrecoverable OWR statement (The official report passage is a proof and local-model exposition, not an open mathematical problem.)

OWR-12697689-001 | Conjectures on Resolutions and Singular Rings

Unrecoverable OWR statement (The official report confirms that this record is a table-of-contents fragment rather than a mathematical question. No separate clean stateme)

OWR-12697689-009 | Introduction to the Weak-Implies-Strong Conjecture

Duplicate/merged OWR extraction (The official report confirms that this record is an introductory fragment for the weak-implies-strong conjecture, whose complete statement a)

OWR-12697689-010 / p.316

OWR-12697692-001 | Behavioral and Seasonal Effects on COVID-19 Transmission

Unrecoverable OWR statement (The question is a presentation heading answered empirically in the following discussion of mobility, seasonality, and viral variants, not a)

OWR-12697692-002 | Exchangeability Tests for Branching in Timed Phylogenies

Unrecoverable OWR statement (The question is a talk heading introducing a developed exchangeability test for branching times, not an unresolved mathematical problem. No)

OWR-12697708-001 | Unspecified Reinforced Random Process Problem

Unrecoverable OWR statement (The official report passage only describes the workshop's discussion sessions and lists contribution titles without stating a mathematical p)

OWR-12697708-005 | Mathematical Characterization of Condensation in Reinforced Systems

Unrecoverable OWR statement (The extracted phrase is a section heading that the ensuing exposition answers by defining and illustrating condensation; it is not an open p)

OWR-12697709-001 | Unspecified Weak Space-Time PDE Optimization Problem

Unrecoverable OWR statement (The official report passage presents optimization models and proved first-order conditions but does not state an unresolved mathematical que)

OWR-12697710-010 | Context-Free Open-Problem Label

Unrecoverable OWR statement (The official report contains only the words “Open Problem” at this extraction boundary, with no recoverable mathematical content. No separat)

OWR-12697711-001 | Real Algebraic Geometry Workshop Overview

Unrecoverable OWR statement (The official report confirms that this extraction is a workshop-summary paragraph and contains no standalone open problem.)

OWR-12697711-007 | Orphaned Discotope Conjecture Label

Unrecoverable OWR statement (The official report confirms that the extraction is only an orphaned conjecture label; the complete conjecture is preserved in the adjacent)

OWR-12697712-001 | Complexity of Counting versus Recovering Planted Communities

Unrecoverable OWR statement (The contribution asks whether community statistics can be easier to infer than communities themselves and then states that its low-degree lo)

OWR-12697712-003 | Chromatic Numbers of Exchangeable Graphon Random Graphs

Duplicate/merged OWR extraction (The passage summarizes proved results for block and approximable graphons and does not itself state the complete general conjecture; the con)

OWR-12697712-004 / p.1779

OWR-12723-003 | Duplicate Halton-Kronecker Discrepancy Question

Duplicate/merged OWR extraction (This record is the same Halton-Kronecker discrepancy problem represented canonically and with the missing definition of ϕ_2 by OWR-1272)

OWR-12723-004 / p.1426

OWR-12724-005 | Monotonicity of Sofic Model Counts

Answered in the source or not an open problem (solved (answered in the source; not a research problem))

OWR-12725-008 | Independent-Kernel Heuristic for Refined abc Bounds

Unrecoverable OWR statement (Checked against the official Oberwolfach report. The source explicitly labels independence of the three kernels as a heuristic assumption us)

OWR-12727-002 | Answered Reconstruction of Contact Structures from Contact Lines

Answered in the source or not an open problem (solved (yes, if X is not projective space; answered in the source))

OWR-12733-002 | Cellular Response to Mechanical Stress

Unrecoverable OWR statement (Checked against the official Oberwolfach report. The source poses this as a rhetorical question and immediately reports an experimental and)

OWR-1274-017 | Duplicate: Weak Greenberg Conjecture for CM Fields

Duplicate/merged OWR extraction (The official Oberwolfach report was checked directly. This extraction repeats the same source problem as OWR-1274-016 and contains no indepe)

OWR-1274-016 / p.196

OWR-12861-017 | Unit Distances in Rational Directions

Answered in the source or not an open problem (solved (a theorem, answered in the source))

OWR-12861-024 | Determinant of a Longest-Increasing-Subsequence Matrix

Unrecoverable OWR statement (The official problem session itself inconsistently names the matrix M and A, indexes its columns by an apparent proper subset of S_n w)

OWR-12866-003 | Duplicate Composite: Nyman Criterion and Autocorrelation Maximum

Duplicate/merged OWR extraction (This extraction merely combines the two source questions represented canonically and separately by OWR-12866-002 and OWR-12866-004. No separ)

OWR-12866-002 / p.173 OWR-12866-004 / p.138

OWR-12870-007 | Finiteness of Negative Extremal Rays for KLT Pairs

Answered in the source or not an open problem (solved (no; answered in the source))

OWR-12870-012 | Probability Convergence of Metrics on Linear Series

Answered in the source or not an open problem (solved (yes, for ample type; answered in the source))

OWR-12872-010 | Enumeration of Pairwise-Compatible Triple Families

Statement proved later in the same workshop report (marked unrecoverable/not an open problem in owr_statement_audit.json)

OWR-12979-011 | Answered Drury-Arveson Kernel-Norm Question

Answered in the source or not an open problem (solved (no, for n ≥ 2; answered in the source))

OWR-12988-001 | Peridynamics as a Multiscale Mechanics Model

Unrecoverable OWR statement (Checked against the official Oberwolfach report. The phrase is a rhetorical heading followed by an explanation of why peridynamics is useful)

OWR-12988-002 | Adaptive Galerkin Discretization of Peridynamics

Unrecoverable OWR statement (Checked against the official Oberwolfach report. The source presents the listed finite-element choices as a proposed computational construct)

OWR-13101-002 | Duplicate Summary: Canonical Bases for Log Calabi-Yau Varieties

Duplicate/merged OWR extraction (The source sentence is an introductory summary of the detailed Gross-Hacking-Keel conjecture represented by OWR-13101-003, not a separate ma)

OWR-13101-003 / p.747

OWR-13103-002 | Mass-Preserving Decomposition of Normal Currents

Answered in the source or not an open problem (solved (no; answered in the source))

OWR-13108-011 | Duplicate Hyperbolic Dehn-Filling Bounded-Height Question

Duplicate/merged OWR extraction (The official report contains one bounded-height conjecture for Dehn fillings, represented canonically by OWR-13108-010. This record repeats)

OWR-13108-010 / p.1241

OWR-13109-001 | Abundance Conjecture for Projective Minimal Models

Duplicate of canonical problem AG-002

AG-002 / p.738

OWR-13110-015 | Embedding Triangular 2-Complexes in 3-Space

Answered in the source or not an open problem (solved (decidable; answered in the source))

OWR-1323-002 | Paths of Hypercyclic Operators with Common Vectors

Answered in the source or not an open problem (solved (yes; answered in the source))

OWR-13351-014 | Birational Anabelian Reconstruction over Finitely Generated Fields

Answered in the source or not an open problem (solved (yes; answered in the source))

OWR-13351-016 | Duplicate Statement of the Mod-ℓ Bogomolov-Pop Conjecture

Duplicate/merged OWR extraction (The official report shows that this declarative extraction and OWR-13351-017 state the same mod-ℓ Bogomolov-Pop conjecture; OWR-13351-0)

OWR-13351-017 / p.150

OWR-13353-016 | Duplicate Triangle-Cone Characterization

Duplicate/merged OWR extraction (This extraction repeats verbatim the graph-triangle-cone problem represented canonically by OWR-13353-015. No separate clean statement is pr)

OWR-13353-015 / p.1865

OWR-13353-022 | Duplicate Constant-Gap Facility-Location Relaxation

Duplicate/merged OWR extraction (This extraction repeats the capacitated-facility-location relaxation question represented canonically by OWR-13353-021. No separate clean st)

OWR-13353-021 / p.2065

OWR-13355-002 | Duplicate Diffraction-to-Dynamical-Spectrum Conjecture

Duplicate/merged OWR extraction (This declarative extraction is the same conjecture as the question represented canonically by OWR-13355-001. No separate clean statement is)

OWR-13355-001 / p.2115

OWR-13358-003 | Individual Conceptions and Classroom Mathematical Norms

Mathematics Education and Classroom Pedagogy workshop report (didactics, not a mathematical research problem)

OWR-13358-004 | Classroom Participation and Mathematical Growth Trajectories

Mathematics Education and Classroom Pedagogy workshop report (didactics, not a mathematical research problem)

OWR-13358-005 | Learning Trajectories in History-Based Mathematics Curricula

Mathematics Education and Classroom Pedagogy workshop report (didactics, not a mathematical research problem)

OWR-13358-006 | Perceived Difficulty in Mathematical Activity

Mathematics Education and Classroom Pedagogy workshop report (didactics, not a mathematical research problem)

OWR-13358-007 | Proof Scripts and Proof Comprehension

Mathematics Education and Classroom Pedagogy workshop report (didactics, not a mathematical research problem)

OWR-13358-008 | Subject Matter Effects on Mathematical Structures

Mathematics Education and Classroom Pedagogy workshop report (didactics, not a mathematical research problem)

OWR-13488-012 | Composite of Unrelated Hyperbolic-Group Questions

Unrecoverable OWR statement (The official report shows that the extraction combines Steenbock's Kaplansky zero-divisor question with Rüping's separate Farrell-Jones ques)

OWR-13489-005 | Minimal Ambient Dimension for Complete Bounded Complex Submanifolds

Answered in the source or not an open problem (solved (no; answered in the source))

OWR-13490-010 | Duplicate Lefschetz-Injectivity Extraction

Duplicate/merged OWR extraction (The passage duplicates the same Lefschetz-injectivity question recorded in OWR-13490-011 and adds no independent problem. No separate clean)

OWR-13490-011 / p.258

OWR-13497-001 | Duplicate Four-Agent Formation-Control Heading

Duplicate/merged OWR extraction (The official report poses a specific saddle-point question for incorrect equilibria, represented by OWR-13497-006. This broad heading-level)

OWR-13497-006 / p.1608

OWR-13497-002 | Expository Packet-Scheduling and Traffic-Control Results

Unrecoverable OWR statement (The official report presents two illustrative cyber-physical-systems results, not unresolved problems: it says a sharp characterization of f)

OWR-13497-004 | Inferred Stronger Four-Agent Formation Claim

Duplicate/merged OWR extraction (The official report asks whether incorrect equilibria are saddle points; it does not pose this stronger global-convergence assertion as a se)

OWR-13497-006 / p.1608

OWR-13497-005 | Duplicate General Four-Agent Formation Question

Duplicate/merged OWR extraction (This is a broad restatement of the same-report question represented precisely by OWR-13497-006, rather than a separate mathematical problem.)

OWR-13497-006 / p.1608

OWR-13499-001 | Duplicate Chromatic-Splitting Extraction

Duplicate/merged OWR extraction (The passage duplicates the chromatic splitting conjecture recorded in OWR-13499-002 and does not state a distinct problem. No separate clean)

OWR-13499-002 / p.1026

OWR-13674-011 | Marcus-Spielman-Srivastava Theorem Extraction

Answered in the source or not an open problem (solved (a proven theorem, not a question))

OWR-13674-012 | Kadison-Singer Paving Theorem Extraction

Answered in the source or not an open problem (Suggest: solved for both, or flag both as not a problem.)

OWR-13678-007 | Hermite-Projector Theorem Extraction

Answered in the source or not an open problem (solved (a theorem, not a problem))

OWR-13678-009 | Duplicate Complete-Intersection Extraction

Duplicate/merged OWR extraction (The passage is a duplicate extraction of the commuting-matrix problem recorded in OWR-13678-008. No separate clean statement is promoted; th)

OWR-13678-008 / p.267

OWR-13686-010 | Duplicate Reduced-Structure-Group Lower Bound

Duplicate/merged OWR extraction (This extraction repeats the reduced-structure-group rank conjecture represented canonically and with definitions by OWR-13686-009. No separa)

OWR-13686-009 / p.1128

OWR-13750328-001 | Representation-Theory Workshop Overview

Unrecoverable OWR statement (The official report confirms that this extraction is a workshop overview and contains no standalone open problem.)

OWR-13750328-002 | Representation-Theory Table-of-Contents Fragment

Unrecoverable OWR statement (The official report confirms that this extraction is a table-of-contents fragment, not a standalone open problem.)

OWR-13750328-016 | Character-Field Conjecture Introduction

Unrecoverable OWR statement (The official report confirms that this extraction is only an incomplete setup; the following record preserves the full conjecture.)

OWR-13750331-001 | Energy Costs of Unspecified Molecular Mechanisms

Unrecoverable OWR statement (The extracted question introduces a talk's already-developed model of energetic cost in molecular-clock synchronization and is followed by i)

OWR-13750331-002 | Reconstruction of Chromosome Structure from Contact Maps

Unrecoverable OWR statement (The extracted phrase is a figure caption answered by the pictured contact map; the surrounding contribution describes established three-dime)

OWR-13750334-001 | Galkin-Usnich Floer-Potential Conjecture Fragment

Unrecoverable OWR statement (The official report confirms that this workshop-introduction fragment refers broadly to the Galkin-Usnich conjecture but does not state its)

OWR-13750336-001 | Fourier Restriction and Kakeya Incidence Conjectures

Unrecoverable OWR statement (The official report confirms that this is workshop-level motivation about incidence problems rather than a separately formulated conjecture.)

OWR-13750336-002 | Unspecified Harmonic Analysis Incidence Problem

Unrecoverable OWR statement (The extraction is a table-of-contents fragment and contains no mathematical problem. No separate clean statement is promoted, and the origin)

OWR-13750336-009 | Equidistribution Rates for Semisimple Torus Random Walks

Unrecoverable OWR statement (The motivating equidistribution question is answered immediately in the contribution by the two stated semisimple random-walk theorems. No s)

OWR-13750336-013 | Endpoint Sparse Bounds for Planar Averaging Operators

Duplicate/merged OWR extraction (The extraction is a sentence fragment from the same Bochner-Riesz contribution whose complete open boundary-segment question is retained in)

OWR-13750336-014 / p.1286

OWR-13750341-001 | Unspecified P-Adic Euler System Conjecture

Unrecoverable OWR statement (The extraction begins with the trailing word of a Bloch-Kato reference and then states proved Euler-system and regulator theorems; it contai)

OWR-13750341-002 | Unspecified Abelian Surface BSD Conjecture

Unrecoverable OWR statement (The extraction joins the end of a proved Gross-Zagier converse discussion to an abelian-surface BSD application theorem, without stating a s)

OWR-13852-002 | Duplicate Deformed Hermitian-Yang-Mills Stability Criterion

Duplicate/merged OWR extraction (The official report contains one numerical subvariety criterion for solvability of the deformed Hermitian-Yang-Mills equation, represented c)

OWR-13852-001 / p.711

OWR-13852-005 | Cross-Report Duplicate of the Normal Mod-Two Current Question

Duplicate/merged OWR extraction (This report repeats exactly the normal mod-two current question already represented by the earlier OWR-13103-005 record from Oberwolfach Rep)

OWR-13103-005 / p.1325

OWR-13856-003 | Expository Metastability Heading for a Nonlocal Dirichlet Problem

Duplicate/merged OWR extraction (The official report uses this broad question as the title and motivation for an account that proves existence of stationary metastable profi)

OWR-13856-004 / p.1504

OWR-13856-008 | Motivating Fixed-Point Question for Chinese Restaurant Permutations

Unrecoverable OWR statement (The official report introduces this pathwise question as motivation and then gives the relevant time-change limit results rather than presen)

OWR-13857-004 | Duplicate Weighted-Curvature Extraction

Duplicate/merged OWR extraction (The passage duplicates the weighted-curvature flow alternatives recorded in OWR-13857-005 and does not state an independent problem. No sepa)

OWR-13857-005 / p.863

OWR-13859-001 | Pointwise Subsequence Convergence of Approximation Operators

Answered in the source or not an open problem (solved (no; answered in the source))

OWR-1386-003 | Sampling Algorithms for Maximum-Cut Density

Answered in the source or not an open problem (solved (max-cut density is testable; answered in the source))

OWR-1386-013 | Codegree Thresholds for Hypergraph Hamilton Cycles

Duplicate extraction; the canonical question is OWR-1782-009.

OWR-1782-009 / p.1644

OWR-1386-020 | Runtime Thresholds for Ant-Colony Optimization

Answered in the source or not an open problem (solved (answered in the source))

OWR-1392-001 | Displacement Convexity and Ricci Curvature

Answered in the source or not an open problem (solved (a theorem recalled in the source))

OWR-1393-003 | Reconstruction of Extended Affine Lie Algebras from Lie Tori

Answered in the source or not an open problem (solved (answered in the source))

OWR-1394-002 | Alexandrov Uniqueness Conjecture for Convex Surfaces

Answered in the source or not an open problem (solved (no; answered in the source))

OWR-1394-008 | Thin-Shell Concentration for Isotropic Convex Bodies

Answered in the source or not an open problem (solved (yes; answered in the source))

OWR-13941-003 | Unspecified Convex-Hull Conjecture for a Pooling Relaxation

Unrecoverable OWR statement (The official report only says that a structured nonconvex pooling relaxation has a conjectured full convex-hull description in the remaining)

OWR-13948-003 | Duplicate Quasiconvexity Extraction

Duplicate/merged OWR extraction (The passage duplicates the multiple-valued quasiconvexity question recorded in OWR-13948-004. No separate clean statement is promoted; the o)

OWR-13948-004 / p.1349

OWR-13951-014 | Duplicate Petty-Conjecture Extraction

Duplicate/merged OWR extraction (The passage duplicates Petty’s projection-body conjecture recorded in OWR-13951-015. No separate clean statement is promoted; the original r)

OWR-13951-015 / p.923

OWR-14222-008 | Combinatorial Multiplicity Indices and Terao Conjecture

Answered in the source or not an open problem (solved (the implication is proved; answered in the source))

OWR-14224-001 | Detection Gaps Between Parametric and Kernel Tests

Answered in the source or not an open problem (solved (answered in the source))

OWR-14224-002 | Adaptive Honest Confidence Intervals Under Moderate Sparsity

Answered in the source or not an open problem (solved (answered in the source))

OWR-14224-003 | Oracle Quality Confidence Intervals with Unknown Sparsity

Answered in the source or not an open problem (solved (no in general; answered in the source))

OWR-14297732-001 | Geometric Analysis Table-of-Contents Fragment

Unrecoverable OWR statement (The official report confirms that this record is a table-of-contents fragment rather than a mathematical question. No separate clean stateme)

OWR-14297732-002 | Einstein Metrics Table-of-Contents Fragment

Unrecoverable OWR statement (The official report confirms that this record is a continuation of the table of contents rather than a mathematical question. No separate cl)

OWR-14297733-004 | Uniform Long-Time Sobolev Bounds for Nonlinear Beam Equations

Unrecoverable OWR statement (The long-time Sobolev-bound question is followed immediately by the contribution's stability theorem, which supplies the requested constant)

OWR-14297736-001 | Spectral-Geometry Workshop Overview

Unrecoverable OWR statement (The official report confirms that this extraction is a workshop summary and open-session introduction, not a standalone mathematical problem)

OWR-14297736-012 | Spherical Neumann-Eigenvalue Context

Unrecoverable OWR statement (The official report confirms that this extraction is explanatory material duplicated by the adjacent complete open problems.)

OWR-14297736-016 | Duplicate Spherical Robin-Eigenvalue Question

Unrecoverable OWR statement (The official report confirms that this extraction duplicates the complete open problem preserved in the preceding record.)

OWR-14297736-019 | Genus-Free Steklov-Eigenvalue Bound

Unrecoverable OWR statement (The official report gives a counterexample and explicitly explains why the genus dependence cannot be removed; the extracted question is res)

OWR-14297736-020 | Universal Steklov Isoperimetric Questions

Unrecoverable OWR statement (The official report answers both extracted questions negatively by giving unbounded constructions, so they are not open problems.)

OWR-14297740-001 | Unspecified Anabelian Galois Representation Conjecture

Unrecoverable OWR statement (The extraction is workshop-introduction prose ending in a reference to the Coleman conjecture; the report states no separate conjecture at t)

OWR-14297740-002 | Unspecified Anabelian Geometry Conjecture

Unrecoverable OWR statement (The extraction is a composite workshop overview of several research programs rather than a formulated mathematical problem. No separate clea)

OWR-14297740-008 | Anderson-Ihara Maximal Pro-p Extension Conjecture

Unrecoverable OWR statement (The report explicitly says that this historical Anderson-Ihara question has an affirmative answer under the former Deligne-Ihara conjecture,)

OWR-14297740-010 | Jannsen Finiteness for Galois Cohomology

Unrecoverable OWR statement (The extraction only notes that one finiteness hypothesis in a proved theorem is a special case of Jannsen's broader conjecture and does not)

OWR-14297741-004 | Kasparov-Theory Heading Fragment

Unrecoverable OWR statement (The official report confirms that this extraction combines the end of preceding exposition with the heading of the Kasparov-theory contribut)

OWR-14297744-001 | Equivariant Homotopy-Theory Workshop Abstract

Unrecoverable OWR statement (The official report confirms that this extraction is a workshop abstract and contains no standalone open problem.)

OWR-14297744-002 | Equivariant Homotopy-Theory Table-of-Contents Fragment

Unrecoverable OWR statement (The official report confirms that this extraction is a table-of-contents fragment, not a standalone open problem.)

OWR-14297744-004 | Orphaned Equivariant h-Cobordism Conjecture Label

Unrecoverable OWR statement (The official report confirms that this extraction is only an orphaned heading and conjecture label; the complete problems are preserved in t)

OWR-14297746-005 | Random Perturbations of Aperiodic Schrödinger Potentials

Unrecoverable OWR statement (The official report asks this introductory question and then answers it with localization and spectral-structure theorems; the remaining Fib)

OWR-14297746-007 | Duplicate Random-Perturbation Question

Unrecoverable OWR statement (The official report confirms that this extraction repeats Question 4, which is preserved in the preceding record.)

OWR-14298007-011 | Simplicial-Polytope Reconstruction Overview

Unrecoverable OWR statement (The official report uses this broad question to introduce known results and two precise conjectures; the surviving open case is preserved in)

OWR-14298008-001 | Multiplication of Low-Regularity Functions

Unrecoverable OWR statement (The official report asks this expository question and immediately answers it with Young's theorem, including the exact regularity criterion.)

OWR-14298008-002 | Equilibration from Log-Sobolev Inequalities

Unrecoverable OWR statement (The official report uses this question to introduce log-Sobolev inequalities and then gives quantitative exponential equilibration bounds; i)

OWR-14298009-002 | Information Loss and an Intrinsic Arrow of Time

Answered in the source or not an open problem (solved (answered in the source))

OWR-14298009-003 | Quantum Operations from Temporal Asymmetry

Answered in the source or not an open problem (solved (yes; answered in the source))

OWR-14298009-005 | Channel-Divergence Discussion

Unrecoverable OWR statement (The official report only says that open questions were discussed; it does not state any question that can be reconstructed as a standalone p)

OWR-14298013-006 | Poisson Ideals of the Virasoro Algebra

Unrecoverable OWR statement (The official report lists these questions as motivation and then states that the authors answer all of them; the extraction is not an unreso)

OWR-14298014-001 | Reduced-Density-Matrix and RPA Discussion Fragment

Unrecoverable OWR statement (The official report mentions possible links between reduced-density-matrix conditions and random-phase approximation as a broad research dir)

OWR-14298158-001 | Permutation-Patterns Table-of-Contents Fragment

Unrecoverable OWR statement (The official report confirms that this record is a table-of-contents and heading fragment rather than a mathematical question. No separate c)

OWR-14298158-010 | Separable-Permutation Enumeration Introduction

Duplicate/merged OWR extraction (The official report confirms that this extraction repeats the rationality question already represented by OWR-14298158-002 and otherwise con)

OWR-14298158-002 / p.1723

OWR-14298158-016 | Point-Probability Criterion Commentary

Unrecoverable OWR statement (The official report confirms that this fragment comments on a proved point-probability criterion and does not state an additional conjecture)

OWR-14298158-015 / p.1657

OWR-14298159-006 | Balmer-Spectrum Motivation

Unrecoverable OWR statement (The official report uses this broad question to motivate the three precise tensor-triangular questions preserved in the following record.)

OWR-14298160-001 | Artin-Group Workshop Introduction

Unrecoverable OWR statement (The official report confirms that this is introductory workshop context duplicating the concrete Artin-group problems preserved below.)

OWR-14298160-002 | Homological Motivation from Stability Conditions

Unrecoverable OWR statement (The official report states a broad research motivation rather than a mathematically delimited open problem.)

OWR-14298160-006 | Definition of the Coxeter Galaxy

Unrecoverable OWR statement (The official report uses this phrase as a section heading and then defines the Coxeter galaxy; it is not an open problem.)

OWR-14298160-007 | Coxeter-Galaxy Structure Overview

Unrecoverable OWR statement (The official report uses this phrase as a section heading and immediately states structural theorems; the remaining questions are preserved)

OWR-14298160-010 | Profinite Rigidity in the Coxeter Galaxy

Unrecoverable OWR statement (The official report uses this phrase as a section heading and follows it with a proved profinite-rigidity theorem for ranks at most three, n)

OWR-14298162-001 | K-Stability Table-of-Contents Fragment

Unrecoverable OWR statement (The official report confirms that this extraction is a table-of-contents fragment ending in the word conjecture, not a mathematical problem.)

OWR-14298162-003 | Duplicate Negative-Part Valuation Question

Unrecoverable OWR statement (The official report confirms that this extraction repeats the same negative-part valuation question preserved in the preceding record.)

OWR-14298163-001 | Discrete-Geometry Problems Table-of-Contents Entry

Unrecoverable OWR statement (The official report confirms that this extraction is a table-of-contents fragment, not a mathematical problem.)

OWR-14298163-013 | No-Three-in-Line Problem

Duplicate of canonical problem COMB-011

COMB-011 / p.1711

OWR-14298169-002 | Workshop Contents Listing for Graph and Groupoid Algebras

Unrecoverable OWR statement (The official report confirms that this extraction is a contents-listing fragment, not a mathematical problem. No separate clean statement is)

OWR-14298169-004 | Move Classification of Countable Vertex-Finite Graphs

Unrecoverable OWR statement (The official report was checked and confirms a genuine eight-part move-classification conjecture, but the extracted text omits the definitio)

OWR-14298170-006 | Positive-Scalar-Curvature Gluing Overview

Unrecoverable OWR statement (The official report confirms that this extraction is only the heading and introduction to three open questions, all preserved in the followi)

OWR-14298170-014 | Scalar-Curvature Rigidity Context

Unrecoverable OWR statement (The official report uses this broad question to introduce a proved rigidity theorem; the remaining precise smoothing question is preserved i)

OWR-14298170-019 | Rotating-Black-Hole Motivation

Unrecoverable OWR statement (The official report confirms that this extraction is contextual motivation duplicated by the complete vacuum Kerr conjecture in the followin)

OWR-14298363-001 | Higher-Dimensional Generalization of a Strassen-Type Result

Unrecoverable OWR statement (The official report says only that a recent one-dimensional generalization of Strassen’s theorem should be extended to higher dimensions; it)

OWR-14298363-009 | Hedge-Supermartingale Exposition

Unrecoverable OWR statement (The official report confirms that this extraction is an expository derivation of the Hedge supermartingale and does not pose a standalone op)

OWR-14298364-008 | Informal Question about a Rescaled Einstein Limit

Unrecoverable OWR statement (The phrase asks only whether a newly obtained limiting metric is 'new or interesting' and does not specify a falsifiable mathematical target)

OWR-14298365-001 | Workshop Summary on Growth and Expansion in Groups

Unrecoverable OWR statement (The official report confirms that the extraction is workshop-summary prose and a list of lecture topics, not a standalone conjecture. No sep)

OWR-14298365-016 | Duplicate Alternating-Group Expander-Power Question

Duplicate/merged OWR extraction (The official report confirms that this extraction repeats the power-of-alternating-groups question already represented canonically by OWR-14)

OWR-14298365-015 / p.603

OWR-14298367-005 | Weighted-Shift Supercyclicity Converse

Unrecoverable OWR statement (The official report asks whether supercyclicity of the associated weighted shift implies supercyclicity of the composition operator and imme)

OWR-14298372-002 | Quantum-Channel Interpolation Characterization

Unrecoverable OWR statement (The official report poses this interpolation question and then gives a necessary-and-sufficient characterization as Theorem 5.)

OWR-14298372-004 | Setup for Noncommutative Stability Conjectures

Unrecoverable OWR statement (The official report confirms that this extraction is introductory setup for Conjectures 10 and 12, both preserved in the following records.)

OWR-14298372-007 | Free-Conjugate-Variable Regularity Overview

Unrecoverable OWR statement (The official report uses this broad question to organize a survey of several established regularity results; it does not isolate an unresolv)

OWR-14298374-001 | Random-Surface Modeling Motivation

Unrecoverable OWR statement (The official report uses this question to introduce the stochastic surface models developed in the remainder of the abstract; it is not a de)

OWR-14298374-002 | Infinite-Resolution Random-Surface Question

Unrecoverable OWR statement (The official report asks whether the limit surface is well defined and immediately answers it through continuity and differentiability crite)

OWR-14298374-006 | Autoencoder Optimization Perspectives

Unrecoverable OWR statement (The official report describes three equivalent optimization viewpoints and their modeling consequences; it does not state an unresolved math)

OWR-14298375-001 | Unspecified Hyperplane Arrangement Conjecture

Answered in the source or not an open problem (solved (not a problem; retire))

OWR-14298376-001 | Unspecified Real Enumerative Geometry Conjecture

Unrecoverable OWR statement (The extraction is a table-of-contents fragment ending in a contribution title, not a mathematical statement. No separate clean statement is)

OWR-14298580-002 | Unspecified Low-Dimensional Topology Conjecture

Unrecoverable OWR statement (The extraction consists only of the trailing word 'conjecture' from the workshop introduction and contains no recoverable target at that loc)

OWR-14298580-005 | Taut Foliations on Rational Homology Spheres

Duplicate/merged OWR extraction (The extraction repeats the taut-foliation and geography context for the L-space conjecture retained in OWR-14298580-004. No separate clean s)

OWR-14298580-004 / p.1125

OWR-14298580-006 | Strong Geography Restrictions in Heegaard Floer Homology

Duplicate/merged OWR extraction (The extraction supplies context and a theorem before introducing the strong-geography question, which is retained completely in OWR-14298580)

OWR-14298580-008 / p.1239

OWR-14298580-010 | Motivic Generalization of Milnor Product Formulas

Answered in the source or not an open problem (solved (answered in the source; the general case is a preprint))

OWR-14298581-001 | Calabi-Yau Torelli Table-of-Contents Fragment

Unrecoverable OWR statement (The official report confirms that this extraction is a table-of-contents fragment and contains no mathematical conjecture.)

OWR-14298581-004 | Isolated Complex-Geometry Question Label

Unrecoverable OWR statement (The extraction contains only the label “Question 1.” The official report has no additional standalone problem at this position beyond the co)

OWR-14298581-009 | Strict Calabi-Yau Automorphism Preamble

Unrecoverable OWR statement (The official report confirms that this extraction stops immediately before the actual questions, which are preserved in the following record)

OWR-14298581-012 | Equivariant Fukaya-Cohomology Discussion

Unrecoverable OWR statement (The official report poses these questions to motivate the talk, immediately rejects the naive first two formulations, and develops a more el)

OWR-14298581-013 | Isolated Hyperkähler Conjecture Label

Unrecoverable OWR statement (The official report confirms that this extraction is an isolated table-of-contents fragment containing only the word “conjecture.”)

OWR-14298583-002 | Observed Extreme-Rainfall Trends

Unrecoverable OWR statement (The official report poses this empirical question and then gives the study’s answer: events became more frequent, while their individual-siz)

OWR-14298584-010 | Duplicate Finite-Field Polynomial-Multiplication Conjecture

Duplicate/merged OWR extraction (The official report confirms that this overlapping extraction repeats the finite-field polynomial-multiplication conjecture represented cano)

OWR-14298584-009 / p.2100

OWR-14298587-001 | Stable Phase-Transition Table-of-Contents Entry

Unrecoverable OWR statement (The official report confirms that this extraction is only a table-of-contents entry, not a mathematical problem.)

OWR-14298588-006 | Categorical Local Langlands Program Summary

Duplicate/merged OWR extraction (The official report confirms that this extraction is introductory programmatic exposition; the categorical local Langlands conjecture itself)

OWR-14298588-008 / p.858

OWR-14298588-007 | Equivalent Categorical Local Langlands Formulation

Duplicate/merged OWR extraction (The official report confirms that this extraction gives an equivalent functorial formulation of the categorical local Langlands conjecture r)

OWR-14298588-008 / p.858

OWR-14298588-012 | Arthur-Eigensheaf Spectral-Side Continuation

Duplicate/merged OWR extraction (The official report confirms that this extraction is discussion and evidence following the Arthur-parameter eigensheaf conjecture represente)

OWR-14298588-010 / p.876

OWR-14298588-015 | Reported Height Theorem for Abelian Isogeny Classes

Unrecoverable OWR statement (The official report states the bounded-height finiteness result as a theorem conditional on the Mumford-Tate conjecture and notes the cases)

OWR-14298589-003 | Mixed Square-Tiled-Surface Talk Transition

Unrecoverable OWR statement (The official report confirms that this extraction joins the end of one contribution to the title and opening sentence of the next and contai)

OWR-14298589-007 | Resolved Averaged Twist-Torus Distribution Lead-In

Duplicate/merged OWR extraction (The official report poses this broad question as a lead-in and immediately gives the authors’ averaged equidistribution theorem; the remaini)

OWR-14298589-008 / p.1927

OWR-14298589-012 | Duplicate Boundary-Regime Poisson-Limit Conjecture

Duplicate/merged OWR extraction (The official report confirms that this overlapping extraction repeats the volume-identity question and boundary-regime Poisson-limit conject)

OWR-14298589-011 / p.1935

OWR-14298591-001 | Workshop Summary on Mathematical General Relativity

Unrecoverable OWR statement (The official report confirms that this extraction is workshop-summary prose covering several talks and contains no standalone problem. No se)

OWR-14298591-003 | Reported Asymptotics for Silent Wave Equations

Unrecoverable OWR statement (The official report presents asymptotic estimates of all orders and a Maxwell-field application as results of the reported work; it does not)

OWR-14298591-004 | Incomplete Lorentzian-Geometry Result Fragment

Unrecoverable OWR statement (The official report confirms that this extraction is a damaged fragment of a result and surrounding technical hypotheses, not a standalone o)

OWR-14298592-001 | Workshop Contents Listing for Low-Dimensional Topology

Unrecoverable OWR statement (The official report confirms that this extraction is a contents-listing fragment, not a mathematical problem. No separate clean statement is)

OWR-14298592-005 | Ribbon-Clasp Obstruction Methods

Unrecoverable OWR statement (The official report describes attempted applications of proved propositions and says that no examples had yet been obtained; it does not for)

OWR-14298795-001 | Workshop Summary on Anabelian Geometry

Unrecoverable OWR statement (The official report confirms that this extraction is workshop-summary prose covering many talks and contains no standalone conjecture. No se)

OWR-14298795-002 | Workshop Contents Listing for Anabelian Geometry

Unrecoverable OWR statement (The official report confirms that this extraction is a contents-listing fragment, not a mathematical problem. No separate clean statement is)

OWR-14298795-009 | Incomplete Nonlinear Eisenstein-Conjecture Continuation

Unrecoverable OWR statement (The official report confirms that this extraction is only a dangling sentence continuing a preceding nonlinear differential-equation conject)

OWR-14298798-001 | Resolved Equilibration-Time Lead-In for Open-Boundary ASEP

Unrecoverable OWR statement (The official report raises the equilibration-time question only as a lead-in and immediately states that the reported joint work obtains the)

OWR-14298802-003 | Workshop Contents Listing for Algebraic K-Theory

Unrecoverable OWR statement (The official report confirms that this extraction is a contents-listing fragment, not a mathematical problem. No separate clean statement is)

OWR-14298802-004 | Expository Telescope-Conjecture Fragment

Unrecoverable OWR statement (The official report confirms that this extraction is background exposition on the telescope conjecture, whose higher-height form is discusse)

OWR-14298802-007 | Reported Structure of Circle-Cochain THH

Unrecoverable OWR statement (The official report discusses structural results for the topological Hochschild homology of spherical cochains on the circle and does not po)

OWR-14298804-002 | Duplicate Strongly Polynomial Linear-Programming Lead-In

Duplicate/merged OWR extraction (The official report confirms that this extraction is contextual commentary about progress toward the strongly polynomial linear-programming)

OWR-14298804-001 / p.2107

OWR-14298804-003 | Workshop Contents Listing for Combinatorial Optimization

Unrecoverable OWR statement (The official report confirms that this extraction is a contents listing of six open-problem contributions, not a standalone problem. No sepa)

OWR-14298804-008 | Duplicate Dimension-Parameterized Zonotope Containment

Duplicate/merged OWR extraction (The official report confirms that this extraction repeats the fixed-parameter tractability question represented canonically by OWR-14298804-)

OWR-14298804-007 / p.2081

OWR-14298804-010 | Duplicate Finite-Strategy Question for the Distance Game

Duplicate/merged OWR extraction (The official report confirms that this extraction repeats the finite-strategy question represented canonically by OWR-14298804-009. No separ)

OWR-14298804-009 / p.2080

OWR-14298804-013 | Duplicate Fare-Zone Approximation Question

Duplicate/merged OWR extraction (The official report confirms that this extraction repeats the tree fare-zone approximation question represented canonically by OWR-14298804-)

OWR-14298804-012 / p.2061

OWR-14298804-015 | Duplicate Light-Tournament Two-Coloring Question

Duplicate/merged OWR extraction (The official report confirms that this extraction repeats the complexity question represented canonically by OWR-14298804-014. No separate c)

OWR-14298804-014 / p.2110

OWR-14298804-017 | Duplicate Fiorini Feedback-Vertex-Set Question

Duplicate/merged OWR extraction (The official report confirms that this extraction is commentary on the still-open Fiorini question represented canonically by OWR-14298804-0)

OWR-14298804-016 / p.2085

OWR-14298805-001 | Survey of Smooth Modular Representations

Unrecoverable OWR statement (The official report presents “what is known and what is not known?” as the heading of a broad survey, not as a standalone mathematical probl)

OWR-14298805-008 | Supercuspidal Character Survey Heading

Unrecoverable OWR statement (The official report uses “What do characters look like?” as an expository section heading and historical organizing question, not as a preci)

OWR-14298808-004 | Classical Busemann-Petty Problem

Answered in the source or not an open problem (solved (answered in the source))

OWR-14298808-005 | Busemann-Petty Problem for Arbitrary Measures

Answered in the source or not an open problem (solved (answered in the source))

OWR-14298808-012 | Duplicate Growing-Parameter Limit Question

Unrecoverable OWR statement (The official report confirms that this extraction is the preamble to, and repeats, the precise asymptotic-distribution question preserved in)

OWR-14298808-014 | Centroidal-Section Introductory Question

Unrecoverable OWR statement (The official report uses this broad sentence to introduce the precise centroidal-section problem preserved in the following record.)

OWR-14299081-001 | Workshop Summary Mention of the Erdős-Hajnal Conjecture

Unrecoverable OWR statement (The official report confirms that this extraction is workshop-summary prose mentioning the Erdős-Hajnal conjecture, which is stated separate)

OWR-14299081-002 | Corrupted Graph-Theory Contents Fragment

Unrecoverable OWR statement (The official report confirms that this extraction is a damaged contents-listing fragment, not a mathematical problem. No separate clean stat)

OWR-14299081-009 | Duplicate Erdős-Hajnal Conjecture Passage

Duplicate/merged OWR extraction (The official report confirms that this extraction repeats the Erdős-Hajnal conjecture represented canonically by OWR-14299081-008. No separa)

OWR-14299081-008 / p.1844

OWR-14299081-010 | Duplicate Erdős-Hajnal Conjecture Passage

Duplicate/merged OWR extraction (The official report confirms that this extraction repeats the Erdős-Hajnal conjecture represented canonically by OWR-14299081-008. No separa)

OWR-14299081-008 / p.1844

OWR-14299081-011 | Truncated Extremal-Graph-Theory Conjecture

Unrecoverable OWR statement (The official report confirms that this extraction contains only an isolated conjecture label and no independently recoverable mathematical s)

OWR-14299081-020 | Duplicate Erdős-Hajnal Conjecture Lead-In

Duplicate/merged OWR extraction (The official report confirms that this extraction is another occurrence of the Erdős-Hajnal conjecture represented canonically by OWR-142990)

OWR-14299081-008 / p.1844

OWR-14299081-023 | Truncated Graph-Theory Conjecture

Unrecoverable OWR statement (The official report confirms that this extraction is a truncated conjecture fragment with no independently recoverable mathematical statemen)

OWR-14299081-024 | Solved Design-Conjecture Prose Fragment

Unrecoverable OWR statement (The official report confirms that this extraction is prose about a new proof of the design Existence Conjecture, not a new open problem. No)

OWR-14299082-001 | Descriptive-Set-Theory Table-of-Contents Fragment

Unrecoverable OWR statement (The official report confirms that this extraction is table-of-contents debris ending in the word “conjecture,” not a recoverable mathematica)

OWR-14299082-005 | Duplicate Generic Point Property Question

Unrecoverable OWR statement (The official report confirms that this extraction repeats Question 5, which is preserved in the preceding record.)

OWR-14299083-001 | Similarity Metrics for Stochastic Processes

Unrecoverable OWR statement (The official report poses this broad question and then presents an optimal-transport construction, proving that the relevant bisimulation me)

OWR-14299083-003 | Adam Optimization Performance

Unrecoverable OWR statement (The official report uses this question as the title of a talk and then supplies its proposed mechanism: heavy-tailed class imbalance creates)

OWR-14299083-004 | Definition of a Causal Representation

Unrecoverable OWR statement (The official report presents this as a broad epistemological framing question rather than a precise mathematical problem with stated hypothe)

OWR-14299083-005 | Criteria for a Good Representation

Unrecoverable OWR statement (The official report poses this as a philosophical organizing question in an expository discussion, not as a standalone mathematical problem.)

OWR-14299084-007 | Duplicate Distribution-Verification Question

Unrecoverable OWR statement (The official report repeats the two motivating questions already preserved in the earlier verifiable-data-science record and then gives the)

OWR-14299084-008 | Evasive-LWE Research-Direction Discussion

Unrecoverable OWR statement (The official report records an open-ended discussion about which research direction to pursue after counterexamples, not a mathematically te)

OWR-14299086-009 | Duplicate Free-Group Word-Measure Conjecture

Unrecoverable OWR statement (The official report confirms that this extraction contains contextual material followed by the same Conjecture 4 preserved in the next recor)

OWR-14299088-001 | Optimization Workshop Contents Fragment

Unrecoverable OWR statement (The official report confirms that this extraction is a damaged table-of-contents fragment, not a mathematical conjecture. No separate clean)

OWR-14299088-015 | Duplicate Dimension-Free Separation-Exponent Problem

Duplicate/merged OWR extraction (The official report confirms that this open-problem-session extraction repeats the dimension-free separation-exponent problem represented ca)

OWR-14299088-010 / p.660

OWR-14299089-006 | Duplicate Minimal Convex-Difference Decomposition Problem

Duplicate/merged OWR extraction (The official report confirms that this overlapping extraction repeats the minimal convex-difference decomposition problem represented canoni)

OWR-14299089-005 / p.2091

OWR-14299093-001 | Landis-Conjecture Table-of-Contents Fragment

Unrecoverable OWR statement (The official report confirms that this extraction is table-of-contents debris, not the statement of a conjecture.)

OWR-14299095-001 | Ensemble Necessity in Data Assimilation

Unrecoverable OWR statement (The official report poses this question as a talk title and then gives a negative experimental answer in its studied setting: a learned sing)

OWR-14299097-001 | Finite-Group-Theory Contents Fragment

Unrecoverable OWR statement (The official report confirms that this extraction is a table-of-contents fragment, not a mathematical conjecture. No separate clean statemen)

OWR-14299097-002 | Finite-Group-Theory Contents Continuation

Unrecoverable OWR statement (The official report confirms that this extraction is a continuation of the table of contents, not a mathematical problem. No separate clean)

OWR-14299281-002 | Algebraic-Groups Contents Fragment

Unrecoverable OWR statement (The official report confirms that this extraction is a table-of-contents fragment spanning unrelated talks and does not state a mathematical)

OWR-14299281-003 | Truncated Algebraic-Group Conjecture

Unrecoverable OWR statement (The official report confirms that the extracted sentence omits both the conjecture and the name to which it refers, so a mathematical statem)

OWR-14299283-006 | Duplicate Thin-Affine-Grassmannian Question Continuation

Duplicate/merged OWR extraction (The official report confirms that this extraction is a concluding sentence pointing back to the question represented canonically by OWR-1429)

OWR-14299283-002 / p.251

OWR-14299283-011 | Reported Quasi-BPS Construction

Unrecoverable OWR statement (The official report presents the quasi-BPS category as the authors' proposed and partially established answer to a preceding geometric-reali)

OWR-14299284-003 | Truncated Derived-Category Conjecture

Unrecoverable OWR statement (The official report confirms that the extraction contains only the phrase introducing a conjecture and omits the conjecture itself. No separ)

OWR-14299284-011 | Duplicate Atomic-Decomposition Extraction

Duplicate/merged OWR extraction (The official report confirms that this extraction is an overlapping lead-in to the same atomic semiorthogonal-decomposition conjecture repre)

OWR-14299284-012 / p.640

OWR-14299285-002 | Resolved Directed-Landscape Converse Lead-In

Unrecoverable OWR statement (The official report asks this converse question only as a lead-in and immediately answers it with the stated theorem, so the extraction is n)

OWR-14299288-001 | Toric-Geometry Contents Fragment

Unrecoverable OWR statement (The official report confirms that this extraction is a damaged table-of-contents fragment, not a mathematical conjecture. No separate clean)

OWR-14299288-007 | Duplicate Zero-Mutable Log-Resolution Conjecture

Duplicate/merged OWR extraction (The official report confirms that this introductory extraction states the same zero-mutable log-resolution conjecture represented canonicall)

OWR-14299288-008 / p.728

OWR-14299289-001 | Relative-Langlands Contents Fragment

Unrecoverable OWR statement (The official report confirms that this extraction is a table-of-contents fragment and does not contain the conjecture whose final word prece)

OWR-14299289-004 | Period-Sheaf Expository Fragment

Unrecoverable OWR statement (The official report confirms that this extraction consists of a definition of the period sheaf followed by the setup for a different period)

OWR-14299289-006 | Solved-Conjecture Tail for Spherical Varieties

Unrecoverable OWR statement (The official report confirms that the extraction is the concluding sentence of an earlier conjecture, immediately saying that it is known in)

OWR-14299289-011 | Duplicate Local Geometric Duality Formulation

Duplicate/merged OWR extraction (The official report confirms that this extraction repeats the local geometric-duality equivalence represented canonically by OWR-14299289-01)

OWR-14299289-010 / p.347

OWR-14299289-016 | Duplicate Global Geometric Duality Conjecture

Duplicate/merged OWR extraction (The official report confirms that this extraction repeats the global geometric-duality conjecture represented canonically by OWR-14299289-01)

OWR-14299289-015 / p.733

OWR-14299289-018 | Geometric Numerical Conjecture Lead-In

Duplicate/merged OWR extraction (The official report confirms that this extraction is an expository overview and setup; the actual geometric numerical conjecture is represen)

OWR-14299289-019 / p.32

OWR-14299291-001 | Corrupted Non-Archimedean-Geometry Contents Fragment

Unrecoverable OWR statement (The official report confirms that this extraction is a damaged contents listing, not a mathematical problem. No separate clean statement is)

OWR-14299292-001 | Computational Group Theory Workshop Narrative

Unrecoverable OWR statement (The official report confirms that this extraction is workshop-summary prose ending at a dangling occurrence of "conjecture", not a standalon)

OWR-14299292-002 | Unnamed Candidate Monster-Subgroup Extensions

Unrecoverable OWR statement (The official report says only that conjugacy-class information produced two candidate groups for the prospective Monster maximal subgroup of)

OWR-14299292-008 | Reported Tensor Null-Pattern Algorithm

Unrecoverable OWR statement (The official report presents an algorithm that either finds a change of basis revealing the prescribed parameterized null pattern or determi)

OWR-14299511-009 | Reported Quantum Search for Binary Fusion Data

Unrecoverable OWR statement (The official report asks how to find binary fusion data efficiently and immediately presents the authors' quantum algorithm as a solution; i)

OWR-14299513-003 | Truncated Harmonic-Analysis Conjecture

Unrecoverable OWR statement (The official report confirms that this extraction contains only an isolated conjecture label and no independently recoverable mathematical s)

OWR-14299516-001 | Truncated Algebraic-K-Theory Abstract Fragment

Unrecoverable OWR statement (The official report confirms that this extraction begins with the tail of a sentence from the workshop abstract and does not contain a stand)

OWR-14299516-004 | Rhetorical Condensed-Cohomology Talk Heading

Unrecoverable OWR statement (The official report confirms that this extraction is a rhetorical talk heading followed by its title and author, not a standalone open probl)

OWR-14299518-002 | Two Erdős Problems on Partial Block Designs

Already answered in the original Oberwolfach workshop report (not an open problem)

OWR-14299518-020 | Resolved Root-Distribution Lead-In for Littlewood Polynomials

Unrecoverable OWR statement (The official report uses the broad root-distribution question as a lead-in to theorems proved in the reported work rather than as a separate)

OWR-14299520-001 | Interdisciplinary Renormalization Discussion Prompt

Unrecoverable OWR statement (The official report confirms that this is a broad workshop-motivation prompt about interaction between physicists and mathematicians, not a)

OWR-14299521-001 | Corrupted Differential-Geometry Contents Fragment

Unrecoverable OWR statement (The official report confirms that this extraction is a damaged contents-listing fragment, not a mathematical problem. No separate clean stat)

OWR-14299574-009 | Proved Symplectic-Cohomology Factorization Fragment

Unrecoverable OWR statement (The official report confirms that this extraction states a refined conjecture only to report that it is proved for all quasihomogeneous comp)

OWR-14299577-008 | Reported Uniform Stability Bound for Twisted Braid-Group Homology

Unrecoverable OWR statement (The official report explains that the required uniform stability bound is proved in the cited work; this extraction is proof exposition surr)

OWR-14299577-009 | Duplicate Reported Twisted Braid-Group Stability Result

Unrecoverable OWR statement (The official report confirms that this overlapping extraction repeats the stable-homology calculation and uniform stability bound already de)

OWR-14299577-010 | Reported Function-Field Moment Result

Unrecoverable OWR statement (The official report states that the cited work proves the fixed-function-field moment formula for sufficiently large odd prime powers and de)

OWR-14299577-022 | Primitive-Root Orders of Elliptic-Curve Frobenius Traces

Answered in the source or not an open problem (partially_solved)

OWR-14299579-003 | Huang-Yang Derivation Fragment

Unrecoverable OWR statement (The official report confirms that this extraction is a formula and exposition from the derivation of a proved Huang-Yang energy expansion, n)

OWR-14299579-004 | Huang-Yang Completion-of-Squares Fragment

Unrecoverable OWR statement (The official report confirms that this extraction is a technical proof fragment describing a completion-of-squares argument, not an open pro)

OWR-14299580-004 | Truncated Yang-Baxter Conjecture

Unrecoverable OWR statement (The official report confirms that the extracted fragment contains only a reference to a conjecture and no recoverable formulation. No separa)

OWR-14299580-011 | Unidentified Hecke-Type Equivalence Class

Unrecoverable OWR statement (The official report asks whether the last item in an unpublished classification list is realizable, but it does not identify that equivalenc)

OWR-14299583-001 | Functional Inequalities Workshop Contents Fragment

Unrecoverable OWR statement (The official report confirms that this extraction is a damaged table-of-contents fragment, not a mathematical conjecture. No separate clean)

OWR-14299583-006 | Reported Mean-Norm Bound for Nonsymmetric Convex Bodies

Unrecoverable OWR statement (The official report identifies the nonsymmetric case as a formerly open problem and then states the authors' theorem $M(K)\leq C\log(n)/\sqr)

OWR-14299583-007 | Reported Nonexistence of Critical Loop-Soup Double Points

Unrecoverable OWR statement (The official report first motivates the critical double-point question and then states the authors' result proving that such double points d)

OWR-14299904-003 | Upper Elements in Grothendieck Schubert Supports

Duplicate extraction; the canonical question is OWR-14299904-002.

OWR-14299904-002 / p.1757

OWR-14299904-006 | Triangle-Counting Figure Caption

Unrecoverable OWR statement (The official report confirms that this extraction is a figure caption whose missing diagram and parameters prevent recovery of a standalone)

OWR-14299904-007 | Duplicate Homotopy Question in Permutahedron-Triangulation Exposition

Duplicate/merged OWR extraction (The official report confirms that this extraction is mostly expository discussion and repeats the explicit homotopy problem represented cano)

OWR-14299904-008 / p.357

OWR-14299905-001 | Workshop-Highlights Fragment

Unrecoverable OWR statement (The official report confirms that this extraction splices conclusions about permanent anticoncentration and Rota’s basis conjecture without)

OWR-14299905-002 | Spectral-Graph-Theory Highlight Fragment

Unrecoverable OWR statement (The official report confirms that this extraction summarizes proved workshop highlights and begins with a stray word from an earlier conject)

OWR-14299905-003 | Combinatorics Contents Fragment

Unrecoverable OWR statement (The official report confirms that this extraction is a table-of-contents fragment spanning unrelated talks and does not state a problem. No)

OWR-14299905-004 | Extremal-Combinatorics Contents Fragment

Unrecoverable OWR statement (The official report confirms that this extraction is another table-of-contents fragment and does not state a problem. No separate clean stat)

OWR-14299905-011 | Solved Sparse-Graph Conjecture Fragment

Unrecoverable OWR statement (The official report confirms that the extraction attaches a stray word to two theorems proving the formerly conjectured sparse-graph stateme)

OWR-14299906-006 | Existence of Nonsofic Groups

Duplicate of canonical problem ALG-008

ALG-008 / p.216

OWR-14299906-011 | Duplicate Higher-Dimensional Kakeya Status

Unrecoverable OWR statement (The official report confirms that this extraction only repeats the higher-dimensional status of the Kakeya conjecture preserved in the prece)

OWR-14299908-001 | Workshop-Summary Extraction Artifact

Unrecoverable OWR statement (The extraction starts with the final word of a preceding reference to Schanuel's conjecture and then continues with workshop-summary prose;)

OWR-14299908-006 | Expository h-Minimality Passage

Unrecoverable OWR statement (The official contribution is expository text introducing h-minimality and summarizing applications; the extracted passage contains no separa)

OWR-14299909-003 | Duplicate Multiple-Eisenstein Relations Preamble

Unrecoverable OWR statement (The official report confirms that this extraction is an informal lead-in to the precise kernel conjecture preserved in the following record.)

OWR-14299909-005 | Critical-Value Conjecture Preamble

Unrecoverable OWR statement (The official report confirms that this extraction is background on period polynomials immediately preceding the complete critical-value conj)

OWR-14299909-007 | Duplicate Critical-Value and Maeda Discussion

Unrecoverable OWR statement (The official report confirms that this extraction is the explanatory continuation of the critical-value conjecture preserved in the precedin)

OWR-14299911-001 | Median Geometry Workshop Contents Fragment

Unrecoverable OWR statement (The official report confirms that this extraction is a table-of-contents fragment, not a mathematical conjecture. No separate clean statemen)

OWR-14299911-009 | Special Cube Complexes Talk Transition

Unrecoverable OWR statement (The official report confirms that this extraction is expository narrative ending with an unspecific reference to questions and then crossing)

OWR-14299911-011 | Median Geometry Problem-List Introduction

Unrecoverable OWR statement (The official report confirms that this extraction is only an introductory sentence for a problem list; the individual mathematical questions)

OWR-14299912-001 | Nonlinear-Waves Workshop Introduction Fragment

Unrecoverable OWR statement (The official report confirms that this extraction is a truncated workshop-summary fragment containing no identifiable conjecture. No separat)

OWR-14299914-002 | Causal-Attention Retrieval Motivation

Unrecoverable OWR statement (The official report uses this question to define its retrieval observable and then derives an asymptotic formula and a rigorous U-shaped ret)

OWR-14299915-001 | Cohomological Finite-Generation Survey Summary

Unrecoverable OWR statement (The official report confirms that this extraction is a programmatic summary of a survey and does not state a standalone open problem. No sep)

OWR-14299915-015 | Synthetic-Building Classification Preamble

Unrecoverable OWR statement (The official report confirms that these broad questions introduce the precise minimal-synthetic-building conjectures preserved in the follow)

OWR-14299915-017 | Duplicate Noncompact Casacuberta-Dicks Question

Duplicate/merged OWR extraction (The official report states that the compact contractible two-dimensional case is solved and leaves exactly the noncompact Casacuberta-Dicks)

OWR-14298007-009 / p.1139

OWR-14299915-025 | Exotic-Four-Sphere Special-Case Discussion

Unrecoverable OWR statement (The official report identifies this fragment as a special case of the preceding doubles question rather than a separate extracted problem. N)

OWR-14299916-008 | Duplicate Human-Alignment Question

Duplicate/merged OWR extraction (This extraction repeats the same human-alignment question retained in OWR-14299916-007 and appends an author name and page footer; it is not)

OWR-14299916-007 / p.2086

OWR-14299916-011 | Duplicate Unified-Theory Question

Duplicate/merged OWR extraction (This concluding rhetorical question repeats the unified-theory problem retained in OWR-14299916-002 and does not introduce a distinct mathem)

OWR-14299916-002 / p.2111

OWR-1452-011 | Jacobian Conjecture for Polynomial Maps

Duplicate of canonical problem SMA-016

SMA-016 / p.303

OWR-1452-018 | Rational Periodic Points from Finite-Field Periodicity

Answered in the source or not an open problem ()

OWR-1453-004 | Reconstructing Complete Local Rings from Finite Quotients

Answered in the source or not an open problem (solved (no in general; answered in the source itself))

OWR-1453-006 | Duplicate Relative Galois Reconstruction Conjecture

Duplicate/merged OWR extraction (This is a redundant, assumption-incomplete paraphrase of the relative Galois reconstruction conjecture recorded precisely as OWR-1453-005 fr)

OWR-1453-005 / p.2037

OWR-14602-009 | Refined Local Langlands Parametrization of Tempered Packets

Duplicate/merged OWR extraction (The official report shows that this record is a second extraction of the refined local Langlands conjecture retained as OWR-14602-010. No se)

OWR-14602-010 / p.605

OWR-14603-003 | Algebraic Values and Relations of Mahler Functions

Answered in the source or not an open problem (solved (answered in the source; made effective by Adamczewski-Faverjon))

OWR-14603-011 | Duplicate Small-Value Sparsity Question for Littlewood Polynomials

Duplicate/merged OWR extraction (The official report contains this small-value counting question once; OWR-14603-013 gives its complete formula and is the canonical clean re)

OWR-14603-013 / p.121

OWR-14604-003 | Discrepancy versus Spectral Expansion in Sparse Regular Graphs

Answered in the source or not an open problem (solved (answered in the source: no in general; yes for Cayley and vertex-transitive graphs))

OWR-14604-010 | Duplicate Three-Event Correlation Question

Duplicate/merged OWR extraction (The official report shows that this extraction duplicates the three-increasing-event problem represented canonically by OWR-14604-009. No se)

OWR-14604-009 / p.1961

OWR-14604-015 | Duplicate Progression-Free-Set Enumeration Question

Duplicate/merged OWR extraction (This extraction duplicates the arithmetic-progression-free enumeration problem represented more completely by OWR-14604-016. No separate cle)

OWR-14604-016 / p.1639

OWR-14605-006 | Expository Automorphic-Correction Description of Lorentzian Kac-Moody Algebras

Duplicate/merged OWR extraction (The official report states that Lorentzian Kac-Moody Lie and superalgebras are automorphic corrections of hyperbolic Kac-Moody algebras as e)

OWR-14605-007 / p.192

OWR-1461-003 | Cramér-Wold Uniqueness for Infinite Signed Measures

Answered in the source or not an open problem (solved (answered in the source))

OWR-14611-006 | Deformation Invariance of Rationality

Answered in the source or not an open problem (solved (no; answered in the source))

OWR-14746-009 | Duplicate Dense Frobenius-Eigenvector Conjecture

Duplicate/merged OWR extraction (The official report states one dense Frobenius-eigenvector conjecture for the convergent completed group algebra, represented canonically by)

OWR-14746-008 / p.52

OWR-14748-011 | Duplicate Thom Conjecture for the Hyperfinite Factor

Duplicate/merged OWR extraction (The official report states Andreas Thom's conjecture once; OWR-14748-012 is the canonical clean record. This entry asks the same question wi)

OWR-14748-012 / p.1438

OWR-15170-005 | Duplicate Northcott-Property Question

Duplicate/merged OWR extraction (This extraction duplicates the bounded-degree-composita Northcott question represented canonically by OWR-15170-004. No separate clean state)

OWR-15170-004 / p.160

OWR-15170-025 | Composite of Unrelated Field-Theory Questions

Unrecoverable OWR statement (The official problem-session list shows that this extraction concatenates several unrelated questions about definable valuations, finitely a)

OWR-15170-028 | Composite of Unrelated Decidability Questions

Unrecoverable OWR statement (The official problem-session list shows that this extraction joins the decidability problem for rigid analytic function rings to a separate)

OWR-15173-002 | Cuspidal Homology for Gaussian Bianchi Congruence Groups

Answered in the source or not an open problem ()

OWR-15181-012 | Irreducible Factorization in Generalized Power Series Rings

Unrecoverable OWR statement (The official report presents the asserted factorization as a proved theorem, with its extension to omnific integers, rather than as an open)

OWR-15207-001 | Gendered Descriptions and the Leaky Pipeline in Mathematics

Unrecoverable OWR statement (The official report presents this as a historical, biographical, or sociological research prompt rather than an open mathematical problem. N)

OWR-15207-003 | Emmy Noether’s Formation of a Mathematical School

Unrecoverable OWR statement (The official report presents this as a historical, biographical, or sociological research prompt rather than an open mathematical problem. N)

OWR-15207-004 | Barriers to Women in Danish Research Mathematics

Unrecoverable OWR statement (The official report presents this as a historical, biographical, or sociological research prompt rather than an open mathematical problem. N)

OWR-15207-005 | Careers of Danish Women Mathematicians

Unrecoverable OWR statement (The official report presents this as a historical, biographical, or sociological research prompt rather than an open mathematical problem. N)

OWR-15207-006 | Historical Scientific Personae and Women Mathematicians

Unrecoverable OWR statement (The official report presents this as a historical, biographical, or sociological research prompt rather than an open mathematical problem. N)

OWR-15207-007 | Practice-Based Personae of Women in Science

Unrecoverable OWR statement (The official report presents this as a historical, biographical, or sociological research prompt rather than an open mathematical problem. N)

OWR-15207-008 | The Woytinskys’ Path to Statistical Prominence

Unrecoverable OWR statement (The official report presents this as a historical, biographical, or sociological research prompt rather than an open mathematical problem. N)

OWR-15207-010 | Gender, Politics, and Rózsa Péter’s Academic Career

Unrecoverable OWR statement (The official report presents this as a historical, biographical, or sociological research prompt rather than an open mathematical problem. N)

OWR-15208-001 | Higher Homotopy of Positive Ricci Observer Moduli Spaces

Answered in the source or not an open problem (solved (yes, for large odd n; answered in the source))

OWR-15208-024 | Infinite Components of Positive Ricci Metric Moduli

Duplicate/merged OWR extraction (The official report shows that this discussion-summary record duplicates the positive-Ricci moduli question retained as OWR-15208-006. No se)

OWR-15208-006 / p.1081

OWR-15208-025 | Components of Nonnegative Curvature Metrics on Homotopy Spheres

Duplicate/merged OWR extraction (The official report shows that this discussion-summary record duplicates the homotopy-sphere moduli question retained as OWR-15208-007. No s)

OWR-15208-007 / p.1031

OWR-15208-028 | Curvature Detection of Exotic Complex Projective Space Bundles

Duplicate/merged OWR extraction (The official report shows that this discussion-summary record restates the projective 3-space bundle question retained as OWR-15208-010. No)

OWR-15208-010 / p.832

OWR-15216-008 | Removing Iterability from HOD-Pair Capturing

Duplicate/merged OWR extraction (The official report shows that this record is a second extraction of the HOD-pair-capturing conjecture retained as OWR-15216-009. No separat)

OWR-15216-009 / p.1977

OWR-15219-018 | Sum of Squares Symmetric Quartics in Higher Dimensions

Unrecoverable OWR statement (The official report answers the higher-dimensional sum-of-squares question immediately by displaying an identity valid for every dimension,)

OWR-1536-008 | Duplicate Game-Chromatic-Index Upper-Bound Question

Duplicate/merged OWR extraction (This is a redundant extraction of OWR-1536-007 from the same official source. No separate clean statement is promoted; the original remains)

OWR-1536-007 / p.1859

OWR-1536-010 | Duplicate Game-Chromatic-Index Lower-Bound Question

Duplicate/merged OWR extraction (This is a redundant extraction of OWR-1536-009 from the same official source. No separate clean statement is promoted; the original remains)

OWR-1536-009 / p.1834

OWR-1537-001 | Linear Independence of Tschakaloff Function Values

Duplicate/merged OWR extraction (The official report confirms that this is the same broad open problem stated more completely, with the defining series, in OWR-1537-011.)

OWR-1537-011 / p.143

OWR-1542-010 | Duplicate: Integral-Point Non-Density on Plane-Divisor Complements

Duplicate/merged OWR extraction (The official Oberwolfach report was checked directly. This extraction repeats the same source problem as OWR-1542-009; no separate clean sta)

OWR-1542-009 / p.137

OWR-15426-002 | Frame Bundles as Stack Fiber Products

Unrecoverable OWR statement (The official report immediately identifies the displayed fiber product with the frame bundle of the vector bundle; this is an answered clari)

OWR-15426-003 | Shtuka Strata as Automorphism Torsors

Unrecoverable OWR statement (The official report immediately explains the stratum as an automorphism-group torsor and a twisted form; this is an answered clarification q)

OWR-15426-004 | Multiplicity One in Cuspidal Automorphic Decompositions

Unrecoverable OWR statement (The official report states and proves the multiplicity-one assertion in the surrounding theorem; this extraction is an answered expository q)

OWR-15427-007 | Flag Sphere Gamma Vectors and Polytope Separation

Duplicate/merged OWR extraction (The official report shows that this record duplicates the flag-sphere gamma-vector problem retained as OWR-15427-004. No separate clean stat)

OWR-15427-004 / p.1058

OWR-15428-011 | Membership Testing in Likelihood Correspondences

Unrecoverable OWR statement (The official report presents the trace test and witness-set construction as the method for deciding this membership question; the extraction)

OWR-15433-008 | Stable Prasad Multiplicity Conjecture

Duplicate/merged OWR extraction (The official report shows that this record is a second extraction of the stable Prasad multiplicity conjecture retained as OWR-15433-007. No)

OWR-15433-007 / p.610

OWR-15433-010 | Geometric Description of Pure Local Arthur Packets

Duplicate/merged OWR extraction (The official report shows that this record duplicates the pure local Arthur-packet conjecture retained as OWR-15433-009. No separate clean s)

OWR-15433-009 / p.355

OWR-15579-006 | Duplicate Edge-Cone Yamabe Nonexistence Conjecture

Duplicate/merged OWR extraction (The official report restates the same edge-cone Yamabe nonexistence conjecture represented canonically and with its standard metric notation)

OWR-15579-002 / p.908

OWR-15581-014 | Duplicate Complexified Volume Conjecture

Duplicate/merged OWR extraction (The official report contains one complexified Volume Conjecture for the colored Jones invariant, represented canonically by OWR-15581-013. T)

OWR-15581-013 / p.1031

OWR-15582-003 | Theorem on Orbicurve Factorization of Holonomy Representations

Duplicate/merged OWR extraction (The official report labels this factorization assertion as Theorem 2 and explains that it supplies evidence for the distinct foliation conje)

OWR-15582-002 / p.1518

OWR-15585-009 | Composite of Unrelated Operator-Algebra Questions

Unrecoverable OWR statement (The official problem-session list shows that this extraction combines the UCT question for finite cyclic crossed products of AF algebras wit)

OWR-1595-008 | Smoothness and Very Ampleness in the Ohsugi-Hibi Example

Answered in the source or not an open problem (solved (no to both; (1) answered in the source, (2) ours))

OWR-15955-001 | Heegaard-Floer Homology and Lattice Cohomology Conjecture

Duplicate/merged OWR extraction (The official report shows that this summary extraction duplicates the precise parity-refined Heegaard-Floer and lattice-cohomology conjectur)

OWR-15955-003 / p.1145

OWR-15956-012 | Odd-Density Limits for Multiplicative Functions

Answered in the source or not an open problem ()

OWR-15956-013 | Contractivity Abscissas of Dirichlet Partial Sums

Answered in the source or not an open problem ()

OWR-15959-001 | Variational Principle for Complete GENERIC Thermodynamics

Duplicate/merged OWR extraction (The official report shows that this record repeats the first half of the two-part GENERIC variational-principle problem retained in full as)

OWR-15959-002 / p.2158

OWR-1596-014 | Duplicate Novikov-Invertibility Polyhedrality Question

Duplicate/merged OWR extraction (The official report and extracted provenance identify this as a redundant copy of the Novikov-invertibility question retained canonically as)

OWR-1596-003 / p.589

OWR-15962-001 | Epidemic Phase Transitions on General Weighted Networks

Duplicate/merged OWR extraction (The official report shows that this is an overview-level summary of the explicit SIS phase-transition conjecture retained as OWR-15962-002.)

OWR-15962-002 / p.1953

OWR-15963-001 | Historical Research Questions on Embodied Mathematics

Unrecoverable OWR statement (The official report presents these as framing questions for historical, philosophical, and educational inquiry rather than as a standalone m)

OWR-15963-003 | Historical Proposal for Concrete Infinitesimal Analysis

Unrecoverable OWR statement (The source is a historical and foundational research proposal about machine-based calculus, not a sufficiently specified mathematical conjec)

OWR-15963-004 | Historical Study of Instruments in Medieval Monasteries

Unrecoverable OWR statement (The source poses historical questions about evidence, motivations, and practice in medieval monasteries rather than a mathematical problem.)

OWR-15963-005 | Historical Uses of Portable Astronomical Instruments

Unrecoverable OWR statement (The source asks an archaeological and historical question about the use and portability of medieval instruments, not a mathematical problem.)

OWR-15963-006 | Historical Classification of Optical Diagrams as Instruments

Unrecoverable OWR statement (The source develops a historiographical classification question about optical diagrams rather than a mathematical problem. No separate clean)

OWR-1598-004 | Duplicate: Addition-Coagulation Similarity Limit with Mismatched Provenance

Duplicate/merged OWR extraction (The extracted text duplicates the addition-coagulation similarity-limit problem represented canonically by OWR-1729-002, but this record poi)

OWR-1729-002 / p.1950

OWR-15986-005 | Composite of Randomness and Hindman-Theorem Questions

Unrecoverable OWR statement (The official open-problem section shows that this extraction concatenates independent questions on low discrepancy of a Martin-Löf random re)

OWR-15986-006 | Composite of Randomness and Scott-Sentence Questions

Unrecoverable OWR statement (The official open-problem section shows that this extraction concatenates the low-discrepancy question with a separate computable-group Scot)

OWR-15986-007 | Composite of Three Independent Computability Questions

Unrecoverable OWR statement (The official open-problem section shows that this extraction combines independent questions about Weihrauch degrees, computable regularity,)

OWR-15987-005 | Duplicate Universal Smooth-Cubic Multisection Problem

Duplicate/merged OWR extraction (The official report contains one classification problem for multisections of the universal smooth cubic family, represented canonically by O)

OWR-15987-004 / p.1045

OWR-15987-018 | Duplicate FI-Type Stability Problem for Braid Groups

Duplicate/merged OWR extraction (The official report states one conjectural FI-type classification of slowly growing braid-group representations, represented canonically by)

OWR-15987-017 / p.352

OWR-15993-002 | Duplicate Brain-Tissue Constitutive-Model Extraction

Duplicate/merged OWR extraction (The official report presents this as the same brain-tissue constitutive-model program represented canonically by OWR-15993-001. No separate)

OWR-15993-001 / p.2138

OWR-15993-004 | Duplicate Organogenesis Branching Extraction

Duplicate/merged OWR extraction (The official report presents this as the same organogenesis problem represented canonically and more completely by OWR-15993-003. No separat)

OWR-15993-003 / p.2180

OWR-15993-007 | Expository Questions About Mathematical Biology

Unrecoverable OWR statement (The official report presents these broad prompts as the framing of an expository discussion about living systems, not as a well-posed open m)

OWR-15995-001 | Optimal Control with Multiplicative Measurement Noise

Duplicate/merged OWR extraction (The official report shows that this is a summary extraction of the scalar multiplicative-observation-noise problem stated precisely in OWR-1)

OWR-15995-002 / p.1611

OWR-16158-009 | Conditional Homogeneous-Space Density Theorem

Unrecoverable OWR statement (The official report states that the asserted Brauer-Manin density conclusion follows from its external Conjecture 9.1; the extracted conditi)

OWR-16158-010 | Established Stabilizer-Induction Step

Unrecoverable OWR statement (The official report proves this inductive step under its external Conjecture 9.1. The extracted conditional assertion is not a separate open)

OWR-16160-014 | Duplicate Weak Warped-Cone Equivalence Question

Duplicate/merged OWR extraction (This record repeats the weak-equivalence question represented canonically by OWR-16160-013 in the same problem session. No separate clean st)

OWR-16160-013 / p.1525

OWR-16162-012 | Finiteness of Genera of Simply Connected Groups

Duplicate/merged OWR extraction (The official report shows that this record is a duplicate extraction of the particular conjectural case already retained in OWR-16162-013. N)

OWR-16162-013 / p.355

OWR-16166-002 | Split Values of Linear and Quadratic Polynomials

Answered in the source or not an open problem (solved (a theorem, not a problem))

OWR-16166-007 | Decidability of Finite Field Extensions

Answered in the source or not an open problem (solved (no; answered in the source))

OWR-16167-018 | Biembeddability and the Golden-Ratio Thompson Group

Unrecoverable OWR statement (The official report shows that this extraction merges two independent numbered questions, one about the biembeddability poset and another ab)

OWR-16167-021 | Homology and Hopficity of Braided Thompson Groups

Unrecoverable OWR statement (The official report shows that this extraction merges three independent numbered questions concerning Hopficity, acyclicity, and a Stein-Far)

OWR-16167-022 | Nonamenable Groups without Free Subgroups

Unrecoverable OWR statement (The official report shows that this extraction merges two independent numbered questions concerning nonamenable groups and Wajnryb-Witowicz)

OWR-16167-024 | Finitely Presented Piecewise-Projective Groups

Unrecoverable OWR statement (The official report shows that this extraction merges two independent numbered questions concerning fast one-bump groups and an embedding of)

OWR-16167-026 | Finiteness Properties of Lodha-Moore Kernels

Unrecoverable OWR statement (The official report shows that this extraction merges two independent numbered questions concerning a Lodha-Moore kernel and a non-finitely-)

OWR-16171-002 | Canonical Comparison of Geometric Local-System Realizations

Duplicate/merged OWR extraction (The official report confirms that this is a duplicate extraction of the same conjecture retained in OWR-16171-001. No separate clean stateme)

OWR-16171-001 / p.620

OWR-16406-004 | Duplicate Cannon-Conjecture Extraction

Duplicate/merged OWR extraction (This record restates Cannon’s conjecture, represented canonically by OWR-16406-003 in the same report. No separate clean statement is promot)

OWR-16406-003 / p.336

OWR-16408-008 | Expository Motivation for Nonreductive GIT

Unrecoverable OWR statement (The official report immediately answers this motivational question by explaining why nonreductive geometric invariant theory enters the modu)

OWR-16409-004 | Geometric Reduction Types of Plane Quartics

Unrecoverable OWR statement (The official report states that the authors answer these reduction-type questions and characterize the answer using Dixmier-Ohno invariants,)

OWR-16411-008 | Well Posed Perturbative Einstein Field Equations

Duplicate/merged OWR extraction (The official report contains one overarching open question about handling perturbatively corrected equations; this generic restatement adds)

OWR-16411-007 / p.1490

OWR-16413-007 | Source-Resolved Random-Domain Modeling Agenda

Unrecoverable OWR statement (The official report poses these questions as the agenda of a contribution and then supplies its well-posedness framework, expectation and de)

OWR-16415-002 | Duplicate Good-Curve-Graph Conjecture

Duplicate/merged OWR extraction (This record is the conjectural answer to the same good-curve-graph question represented canonically and completely by OWR-16415-001. No sepa)

OWR-16415-001 / p.1073

OWR-16416-003 | Duplicate Wobbling-Group Nonamenability Conjecture

Duplicate/merged OWR extraction (The official report presents this as the conjectured negative answer to the extensive-amenability question represented canonically by OWR-16)

OWR-16416-002 / p.1910

OWR-16629-002 | Decomposition of Equiangular Tight Frames

Duplicate/merged OWR extraction (The official report shows that this overview extraction duplicates the precise equiangular-tight-frame decomposition question retained as OW)

OWR-16629-009 / p.834

OWR-16633-011 | The Polynomial Hirsch Conjecture

Duplicate of canonical problem CS-002

CS-002 / p.2108

OWR-16633-015 | Duplicate Path-Cost Arborescence Problem

Duplicate/merged OWR extraction (The official problem session contains one path-cost arborescence hardness problem, represented canonically by OWR-16633-014. This extraction)

OWR-16633-014 / p.2085

OWR-16633-018 | Duplicate Degree-Utility Graph Optimization Problem

Duplicate/merged OWR extraction (This record repeats the graph-complexity question represented canonically and with its objective by OWR-16633-017. No separate clean stateme)

OWR-16633-017 / p.2072

OWR-16633-022 | Duplicate Clique-Sequence Submodularity Conjecture

Duplicate/merged OWR extraction (This extraction repeats the submodularity clause represented canonically and more completely by OWR-16633-021. No separate clean statement i)

OWR-16633-021 / p.1644

OWR-16633-024 | Duplicate Represented-Matroid Minimization Problem

Duplicate/merged OWR extraction (This record repeats the represented-matroid submodular-minimization problem represented canonically by OWR-16633-023. No separate clean stat)

OWR-16633-023 / p.1691

OWR-16634-004 | Defining High-Dimensional Expanders Through Local Spectra

Unrecoverable OWR statement (The official report uses this sentence as an expository heading, immediately supplies a local-spectral definition, and lists different concr)

OWR-16634-005 | Explicit Equations Separating Matrix Multiplication from Low-Rank Tensors

Unrecoverable OWR statement (The official report poses this as a rhetorical transition and immediately answers it by introducing representation-theoretic methods for fin)

OWR-16634-007 | Unique Games Conjecture

Duplicate of canonical problem CS-001

CS-001 / p.2109

OWR-16763-004 | Duplicate Five-Cycle Near-Triangulation Conjecture

Duplicate/merged OWR extraction (This extraction repeats the near-triangulation decomposition conjecture represented canonically and with its computational evidence by OWR-1)

OWR-16763-005 / p.1819

OWR-16763-012 | Duplicate Clustered Hadwiger-Type Conjecture

Duplicate/merged OWR extraction (This record restates the clustered-coloring conjecture represented canonically by OWR-16763-011. No separate clean statement is promoted; th)

OWR-16763-011 / p.1769

OWR-16763-026 | Duplicate Latin-Square Transversal Conjecture

Duplicate/merged OWR extraction (This record repeats the Latin-square transversal conjecture represented canonically and with its matching formulation by OWR-16763-027. No s)

OWR-16763-027 / p.1729

OWR-16763-028 | Composite Duplicate of Two Rainbow-Matching Conjectures

Duplicate/merged OWR extraction (The first clause is represented canonically by OWR-16763-027 and the second by OWR-16763-030. This composite extraction adds no distinct pro)

OWR-16763-027 / p.1729 OWR-16763-030 / p.1695

OWR-16765-002 | Convergence of Finite-Element Mean-Curvature Flow

Answered in the source or not an open problem (solved (yes, as posed; answered in the source))

OWR-16766-002 | Exact Recovery by Lagrangian-Dual Binary Tomography

Duplicate/merged OWR extraction (The official report shows that this is a partial duplicate of the binary-tomography recovery conjecture retained in OWR-16766-003. No separa)

OWR-16766-003 / p.1298

OWR-16766-004 | Binary Tomography Recovery Conjecture

Duplicate/merged OWR extraction (The official report confirms that this is a second complete duplicate of the binary-tomography recovery conjecture retained in OWR-16766-003)

OWR-16766-003 / p.1298

OWR-16767-005 | Duplicate Finite-Element Mean-Curvature-Flow Problem

Answered in the source or not an open problem (solved (yes, as posed; answered in the source))

OWR-16765-002 [not in active corpus]

OWR-16768-010 | Duplicate Localization Conjecture for Finitistic Test Ideals

Duplicate/merged OWR extraction (This record repeats the localization-compatibility problem represented canonically by OWR-16768-003. No separate clean statement is promoted)

OWR-16768-003 / p.266

OWR-16770-003 | Admissibility and Finite Length on the Drinfeld Tower

Duplicate/merged OWR extraction (The official report contains a single two-part conjecture on admissibility and finite length; this extraction duplicates the complete statem)

OWR-16770-002 / p.328

OWR-16772-002 | Duplicate Random Lorentz Gas Invariance Principle

Duplicate/merged OWR extraction (This record repeats the quenched and averaged-quenched random-Lorentz-gas invariance-principle question represented canonically by OWR-16416)

OWR-16416-001 / p.1901

OWR-16776-008 | Robinson's Defect Conjecture and Commuting Sylow Subgroups

Unrecoverable OWR statement (The official report shows that this extraction concatenates two independent conjectures: Robinson's defect conjecture and a criterion for co)

OWR-16931-001 | Oberwolfach Seating Problem

Unrecoverable OWR statement (The official report explicitly answers the sufficiently-large-order Oberwolfach seating problem affirmatively, so this extraction is a prove)

OWR-16931-017 | Decomposing Complete Graphs into Bounded-Degree Regular Factors

Duplicate/merged OWR extraction (The official report confirms the bounded-degree regular-factor conjecture, but the identical conjecture is already represented by the earlie)

OWR-16763-018 / p.1867

OWR-16940-001 | Relative Perturbation Bounds for Empirical Covariance Operators

Unrecoverable OWR statement (The official report presents an approach to relative perturbation bounds for empirical covariance operators, not a standalone unresolved pro)

OWR-16941-011 | Sheaf Models for Modular Category O

Unrecoverable OWR statement (The official report immediately answers this rhetorical question by giving the motivic-sheaf model and its categorical equivalence. No separ)

OWR-1703864-001 | The Riemann Hypothesis

Duplicate of canonical problem MPP-002

MPP-002 / p.189

OWR-1703868-002 | Imprecise Kashiwara-Vergne Symmetry Relation

Unrecoverable OWR statement (The official report says only that the approach illuminates a close relationship conjectured elsewhere between the Kashiwara-Vergne symmetry)

OWR-1703871-003 | Galois Arithmetic of Special Subvarieties in Hodge Variations

Duplicate/merged OWR extraction (Cross-report comparison confirms that this is a second extraction of the special-subvariety descent conjecture retained in OWR-1703867-008.)

OWR-1703867-008 / p.678

OWR-1703872-002 | Large Values of Arithmetic Hyperbolic Three-Manifold Eigenfunctions

Answered in the source or not an open problem (solved (yes, for infinitely many f; answered in the source))

OWR-1703876-017 | Duplicate Discrete-Geometry Problem Collection

Duplicate/merged OWR extraction (The official report confirms that this extraction repeats the hypergraph-coloring, partial-triangulation, polytope, spherical-cap, and pseud)

OWR-1703876-016 / p.1690

OWR-17135-032 | Nonnegative Square Decompositions of Bipartite Determinant Differences

Duplicate/merged OWR extraction (The official report contains one nonnegative square-decomposition question; this extraction duplicates the source-verified formulation retai)

OWR-17135-031 / p.1712

OWR-1728-003 | Stable Homotopy Type of Open-Closed Surface Categories

Answered in the source or not an open problem (solved (a theorem, not a problem))

OWR-17293-007 | Duplicate Erdős-Hooley Typical-Size Extraction

Duplicate/merged OWR extraction (The official report confirms that this extraction repeats the typical-size question and optimal-exponent conjecture represented canonically)

OWR-17293-006 / p.193

OWR-17293-008 | Duplicate Erdős-Hooley Optimal-Exponent Extraction

Duplicate/merged OWR extraction (The official report confirms that this extraction repeats the optimal-exponent part of the Erdős-Hooley question represented canonically by)

OWR-17293-006 / p.193

OWR-17293-016 | Coefficient Normalization of Positive Definite Homogeneous Forms

Answered in the source or not an open problem ()

OWR-17293-017 | Absolutely Convergent Multiplicative Expansions of the von Mangoldt Function

Answered in the source or not an open problem ()

OWR-17296-018 | Duplicate Bounded Negativity Conjecture

Duplicate/merged OWR extraction (The official report confirms that this is a second formulation of the Bounded Negativity Conjecture represented canonically by OWR-17296-011)

OWR-17296-011 / p.643

OWR-17300-007 | Conditional Harder-Congruence Theorem

Duplicate/merged OWR extraction (The official report identifies this extraction as a proved theorem under four explicit hypotheses, not as a separate open problem; the under)

OWR-17300-006 / p.131

OWR-17300-008 | Conditional Modularity Theorem for Chow Cycles

Unrecoverable OWR statement (The official report identifies this extraction as a theorem proved assuming the Bloch-Beilinson conjecture, not as a separately posed open p)

OWR-17300-017 | Cuspidal Spectral-Multiplier Theorem

Unrecoverable OWR statement (The official report identifies this extraction as Theorem 1, a proved spectral-isolation result for non-S-CAP cuspidal representations, not)

OWR-1735-006 | Evaluating Teachers' Responses to Mathematics Test Items

Mathematics Teacher Education workshop report (teacher evaluation and pedagogy policy questions, not mathematical research problems)

OWR-1735-007 | Societal Responsibilities of Mathematics Teacher Educators

Mathematics Teacher Education workshop report (teacher evaluation and pedagogy policy questions, not mathematical research problems)

OWR-1735-008 | Frameworks for Mathematical Knowledge in Teaching

Mathematics Teacher Education workshop report (teacher evaluation and pedagogy policy questions, not mathematical research problems)

OWR-1735-009 | Developing Teachers' Usable Mathematical Knowledge

Mathematics Teacher Education workshop report (teacher evaluation and pedagogy policy questions, not mathematical research problems)

OWR-1738-001 | Structural Problems for Units of Integral Group Rings

Unrecoverable OWR statement (The official report confirms that this extraction is the workshop's broad topic overview rather than a discrete mathematical problem; the de)

OWR-17466-008 | Geometry and Mutation of Quiver Grassmannians

Unrecoverable OWR statement (The official report shows that this extraction concatenates seven independent numbered conjectures and problems rather than one publishable)

OWR-17466-016 | Weighted-Surface Classification of Quaternion-Type Algebras

Duplicate/merged OWR extraction (The official report confirms that this is a duplicate extraction of the Galactic Conjecture retained in OWR-17466-011. No separate clean sta)

OWR-17466-011 / p.220

OWR-17466-017 | Galactic Conjecture for Quaternion-Type Algebras

Duplicate/merged OWR extraction (The official report confirms that this is a duplicate extraction of the Galactic Conjecture retained in OWR-17466-011. No separate clean sta)

OWR-17466-011 / p.220

OWR-17470-009 | Duplicate Ordering-Ratio Dichotomy

Duplicate/merged OWR extraction (This extraction repeats the second question represented canonically, together with its motivating travelling-salesman question, by OWR-17470)

OWR-17470-008 / p.991

OWR-17470-012 | Duplicate Integral-Approximation Question

Duplicate/merged OWR extraction (This record repeats the second question represented canonically by OWR-17470-011. No separate clean statement is promoted; the original reco)

OWR-17470-011 / p.1053

OWR-17470-014 | Duplicate Bestvina-Complex Retraction Question

Duplicate/merged OWR extraction (This record repeats the second question represented canonically by OWR-17470-013. No separate clean statement is promoted; the original reco)

OWR-17470-013 / p.1025

OWR-17475-007 | Duplicate Moment-Matrix Question

Duplicate/merged OWR extraction (This record repeats the first question represented canonically, together with its localization-matrix extension, by OWR-17475-006. No separa)

OWR-17475-006 / p.703

OWR-1782-003 | Quantitative Manipulability of Social Choice Functions

Answered in the source or not an open problem (solved (no, for functions far from non-manipulable ones; answered in the source for three alternatives))

OWR-1795-011 | Twin Prime Conjecture

Duplicate of canonical problem LAN-002

LAN-002 / p.192

OWR-1967-007 | Duplicate: Quantum Invariants and Boundary Character Varieties

Duplicate/merged OWR extraction (The official Oberwolfach report was checked directly. This extraction repeats the same source problem as OWR-1967-006; no separate clean sta)

OWR-1967-006 / p.1206

OWR-1967-009 | Duplicate: Quantum Knot Invariants and Boundary Character Varieties

Duplicate/merged OWR extraction (The official Oberwolfach report was checked directly. This extraction repeats the same source problem as OWR-1967-008; no separate clean sta)

OWR-1967-008 / p.1207

OWR-1970-001 | Characterization of Chaotic Analytic Zero Processes

Unrecoverable OWR statement (The official report uses this as a rhetorical opening to its exposition, not as a discrete research problem. No separate clean statement is)

OWR-2049-005 | Vanishing Pattern for Voronoi Compactification Intersections

Duplicate/merged OWR extraction (The official source confirms that this is a duplicate extraction of OWR-2049-004, not a separate problem. No separate clean statement is pro)

OWR-2049-004 / p.693

OWR-2090-003 | Realizability of Allowable Double-Permutation Sequences

Answered in the source or not an open problem (solved (yes, as intended; answered in the source))

OWR-2489-009 | Subtree Decomposition of Mixed-Integer Convex Hulls

Duplicate/merged OWR extraction (The official report confirms that this repeats the same Conjecture 2 extracted as OWR-2489-004. No separate clean statement is promoted; the)

OWR-2489-004 / p.2069

OWR-2492-003 | Smooth Decomposition of Local Group Action Deformations

Duplicate/merged OWR extraction (The official report confirms that this overview sentence and OWR-2492-004 are two extractions of one source question; OWR-2492-004 preserves)

OWR-2492-004 / p.722

OWR-2654827-008 | Computed Exceptional Hilbert Series

Answered in the source or not an open problem (solved (a theorem, not an open problem))

OWR-2654828-005 | Resolved Weighted-Gaussian-Persistence Lead-In

Unrecoverable OWR statement (The official report presents this as a lead-in to results on weighted sums of correlated Gaussian stationary processes and then states how t)

OWR-2654835-002 | Single-Point Recovery of Time-Dependent Heat Sources

Answered in the source or not an open problem (solved (answered qualitatively in the source))

OWR-2654837-001 | Cultural and Social Variation in Numeracy

History of Everyday Numeracy workshop report (19th-century/medieval historiography, not a mathematical research problem)

OWR-2654837-002 | Objects and Scope of Ancient Mathematics

History of Everyday Numeracy workshop report (19th-century/medieval historiography, not a mathematical research problem)

OWR-2654837-003 | Reach of Axiomatic Deduction and Mathematical Explanation

History of Everyday Numeracy workshop report (19th-century/medieval historiography, not a mathematical research problem)

OWR-2654837-004 | Demographics of Medieval Mathematical Practitioners

History of Everyday Numeracy workshop report (19th-century/medieval historiography, not a mathematical research problem)

OWR-2654837-005 | Professional Status of Medieval Mathematical Practitioners

History of Everyday Numeracy workshop report (19th-century/medieval historiography, not a mathematical research problem)

OWR-2654837-006 | Acquisition of Everyday Numeracy in the Nineteenth Century

History of Everyday Numeracy workshop report (19th-century/medieval historiography, not a mathematical research problem)

OWR-2654837-007 | Arithmetic Education and Numerical Resources in the Nineteenth Century

History of Everyday Numeracy workshop report (19th-century/medieval historiography, not a mathematical research problem)

OWR-2654837-008 | Worldviews as Historical Categories in Mathematics

History of Everyday Numeracy workshop report (19th-century/medieval historiography, not a mathematical research problem)

OWR-3384-005 | Duplicate: Smooth Schubert Cycles from Gelfand-Zetlin Faces

Duplicate/merged OWR extraction (Comparison of the two same-report source-derived extractions confirms that this record repeats OWR-3384-004; no separate clean statement is)

OWR-3384-004 / p.634

OWR-3391-001 | Mathematical Uses of Category Theory

History and Prospects of Category Theory workshop report (sociological and philosophical discussion prompts, not mathematical problems)

OWR-3391-002 | Natural Limits of Categorical Methods

History and Prospects of Category Theory workshop report (sociological and philosophical discussion prompts, not mathematical problems)

OWR-3392-007 | Non-Specific Time-Reflection Research Direction

Unrecoverable OWR statement (The official report records only a suspected deep relationship between time reflection and commutants of von Neumann bimodules, without a ma)

OWR-3393-003 | Duplicate Non-$p\times p$ Specht-Complexity Conjecture

Duplicate/merged OWR extraction (After distinguishing the proved $p\times p$ direction, this record repeats the unresolved maximal-complexity question represented canonicall)

OWR-3393-002 / p.267

OWR-3394-017 | State Recovery from Quantized Nonlinear Trajectories

Duplicate/merged OWR extraction (The official report confirms that this is the broad introductory formulation of the single observability problem stated fully in OWR-3394-01)

OWR-3394-018 / p.2095

OWR-3394-021 | Geometric Criteria for Global Observability

Duplicate/merged OWR extraction (The official report confirms that this restates the same global-observability problem extracted fully as OWR-3394-020. No separate clean sta)

OWR-3394-020 / p.2084

OWR-3396-003 | Model Set Formulations of the Pisot Conjecture

Unrecoverable OWR statement (The official report passage is explanatory prose saying that model sets are natural in constant-length examples and that equivalent formulat)

OWR-3400-005 | Uglov Bipartitions and Hecke Decomposition Numbers

Unrecoverable OWR statement (The official report states these claims as a theorem under Lusztig's Conjecture 14.2 and its parameter hypotheses, not as an open problem. N)

OWR-3477-014 | Duplicate: Cohomology Classes of Undistorted Central Extensions

Duplicate/merged OWR extraction (Comparison of the two same-report source-derived extractions confirms that this record repeats OWR-3477-013; no separate clean statement is)

OWR-3477-013 / p.340

OWR-3478-002 | Positive Ricci Curvature and String Orientation Classes

Answered in the source or not an open problem (solved (no; answered in the source))

OWR-3479-002 | Descriptive Cellular-Membrane Research Theme

Unrecoverable OWR statement (The official report passage describes broad biological motivations for studying cell and organelle shapes but supplies no mathematical varia)

OWR-3480-013 | K_1 Groups and Theta Images of Iwasawa Algebras

Unrecoverable OWR statement (The official report presents the computation and theta-image characterization as Theorem 1.1 and its localized consequence, not as an open p)

OWR-3480-018 | Section Conjecture for Hyperbolic Curves

Duplicate/merged OWR extraction (The official report confirms that this is a second extraction of the same section conjecture preserved fully in OWR-3480-017. No separate cl)

OWR-3480-017 / p.176

OWR-3481-001 | Descriptive Singular-Complex Observation

Answered in the source or not an open problem (solved (a reported theorem, not a problem))

OWR-4085-002 | Uniform Stability of Linearized Quasicontinuum Operators

Answered in the source or not an open problem (solved (no when $\varphi''(2) \neq 0$; answered in the source))

OWR-4127-006 | Incomplete Fourier-Mukai Limit-Cycle Extraction

Unrecoverable OWR statement (The official-source extraction names a degeneration, a Fourier-Mukai transform, and cycles ϕ_η,ϕ_0 without defining any of them.)

OWR-4130-001 | Literal Symbolism in the Development of Algebra

History of Mathematics workshop report (historiographical question, not a mathematical research problem)

OWR-4130-002 | Material Supports for Mathematical Symbolism

History of Mathematics workshop report (historiographical question, not a mathematical research problem)

OWR-4135-002 | Unique Games Approximation-Threshold Conjecture

Duplicate of canonical problem CS-001

CS-001 / p.2109

OWR-4138-001 | Incomplete Strong-Coupling Spectral Formula

Unrecoverable OWR statement (The extracted formula uses the configurations ν^* and ω^1 without defining them, so the official-source fragment is not self-cont)

OWR-4139-002 | Bell Inequality Criteria for Special Unitary Dynamics

Answered in the source or not an open problem (solved (yes; answered in the source))

OWR-4196-005 | Cardinality Characterization of NIP Theories

Unrecoverable OWR statement (The official OWR report proves the displayed gross-model cardinality property for NIP theories, observes that it does not characterize NIP,)

OWR-4211-009 | Incomplete Self-Similar-Tree DtN Uniqueness Claim

Unrecoverable OWR statement (The extracted functional equation asks for “homeomorphic solutions” without defining that solution class, and the phrase is not mathematical)

OWR-4211-010 | Duplicate Acoustic Boundary-Operator Coercivity Question

Duplicate/merged OWR extraction (This is a less explicit duplicate of the acoustic combined-boundary-operator coercivity problem represented canonically by OWR-4211-008 from)

OWR-4211-008 / p.1289

OWR-4213-001 | Source-Mismatched Extremal-Graph Questions

Duplicate/merged OWR extraction (The cited History of Numerical and Graphical Tables report does not contain these extremal-graph questions. Closely related wording occurs i)

OWR-4212-011 / p.1819

OWR-4213-002 | The Odd-Order Simple-Group Problem

History of Mathematics lecture note mentioning the 1963 Feit-Thompson Odd Order Theorem, not an open problem

OWR-4214-003 | Repeated Extraction of Naimark's Problem

Duplicate/merged OWR extraction (The official report presents this Naimark question twice in separate talks; OWR-4214-010 retains the more precise nonseparable formulation.)

OWR-4214-010 / p.1334

OWR-4214-005 | Repeated Extraction of the Toms-Winter Conjecture

Duplicate/merged OWR extraction (The official report contains one statement of this conjecture, duplicated by the extraction as OWR-4214-005 and OWR-4214-007. OWR-4214-007 i)

OWR-4214-007 / p.1439

OWR-4330-002 | Birkhoff Conjecture for Integrable Convex Billiards

Duplicate of canonical problem DYN-004

DYN-004 / p.1457

OWR-4339-007 | Duplicate: ε-Regularity for Donaldson's Equation

Duplicate/merged OWR extraction (Comparison of same-report source-derived extractions confirms that this record repeats OWR-4339-008; no separate clean statement is promoted)

OWR-4339-008 / p.1452

OWR-4341-001 | Novikov Homotopy Invariance Conjecture

Duplicate of canonical problem TOP-006

TOP-006 / p.1140

OWR-4415-001 | Large-Scale Mechanisms Driving Atmospheric Monsoons

Empirical atmospheric-science question ('What drives large-scale monsoons in the Earth's atmosphere?') without a mathematical formulation

OWR-4415-002 | Oceanic Mid-Depth Stratification and Overturning Circulation

Empirical physical-oceanography question ('What sets the oceanic mid-depth stratification and overturning circulation?') without a mathematical formulation

OWR-4415-005 | Nonlinear Coupling of Buoyancy Reversal and Radiation

Descriptive atmospheric-physics question ('Can buoyancy reversal remain nonlinearly coupled to external forcings such as radiation?') without a mathematical model specification

OWR-4415-006 | Errors in Long Equatorial Wave Models

Empirical weather-model error question ('How can the significant errors in the longest equatorial waves be explained or reduced?') without a mathematical formulation

OWR-4425-019 | Repeated Extraction of the Equal-Sum-Factor Problem

Duplicate/merged OWR extraction (The official report contains one occurrence of Problem 47, duplicated by the extraction as OWR-4425-018 and OWR-4425-019. OWR-4425-018 is re)

OWR-4425-018 / p.1700

OWR-4425-021 | Repeated Extraction of the PVHH-Cube Conjecture

Duplicate/merged OWR extraction (The official report contains one occurrence of Conjecture 48, duplicated by the extraction as OWR-4425-020 and OWR-4425-021. OWR-4425-020 is)

OWR-4425-020 / p.1720

OWR-4427-007 | Answered Definition of Burniat Surfaces

Unrecoverable OWR statement (The source heading asks what Burniat surfaces are and the following text immediately gives their construction as bidouble covers from nine-l)

OWR-4528-001 | Defining Higher-Dimensional Elliptic Fibrations

Unrecoverable OWR statement (The official OWR report labels this section “What is an elliptic fibration?”, gives the workshop's common definition, and lists optional ref)

OWR-4531-018 | Duplicate: Boundary Behavior in the Dirichlet Weak Product

Duplicate/merged OWR extraction (Comparison of same-report source-derived extractions confirms that this record repeats OWR-4531-017; no separate clean statement is promoted)

OWR-4531-017 / p.1311

OWR-4532-005 | Answered Discussion of Adaptive Biasing Dynamics

Unrecoverable OWR statement (In the official OWR report this is a rhetorical transition immediately followed by the answer: the adaptive dynamics Y_t converges essenti)

OWR-4535-008 | Duplicate Takhtajan-Zograf Representation Question

Duplicate/merged OWR extraction (This is the first half of the same-report two-part problem represented canonically by OWR-4535-007, with no distinct hypothesis or target. N)

OWR-4535-007 / p.874

OWR-4537-003 | Brumer-Stark Conjecture for Ray Class Groups

Unrecoverable OWR statement (The official OWR report states the T-class-group annihilation conjecture only “modulo a minor technical condition on T” and does not spe)

OWR-4791-006 | Erdős-Shelah Bounds for Union-Free Families

Already answered in the original Oberwolfach workshop report (not an open problem)

OWR-4791-011 | Optimal Constructions for Cycle Saturation

Unrecoverable OWR statement (The claim refers to two diagram-dependent constructions that the report does not specify in recoverable standalone text. No separate clean s)

OWR-4791-016 | Functional Inequality on the Boolean Cube

Duplicate/merged OWR extraction (This is a second extraction of the same Boolean-cube functional inequality preserved in OWR-4791-015. No separate clean statement is promote)

OWR-4791-015 / p.1695

OWR-4791-021 | Maximum Simplicial Depth of Point Configurations

Answered in the source or not an open problem (solved (answered in the source))

OWR-4791-024 | Rosenfeld Conjecture for Oriented Paths

Answered in the source or not an open problem (solved (yes for all n except 3, 5 and 7; answered in the source))

OWR-4798-022 | Duplicate: Polynomial Bounds for Polytope Diameters

Duplicate/merged OWR extraction (Comparison of same-report source-derived extractions confirms that this record repeats OWR-4798-005; no separate clean statement is promoted)

OWR-4798-005 / p.1717

OWR-4800-010 | Theorem: Mutation Compatibility of Generic-Basis Maps

Unrecoverable OWR statement (The official Oberwolfach report states this extraction as a theorem rather than an open problem; no separate clean statement is promoted, an)

OWR-4802-001 | Mathematical Definition of Numerical Tables

History of Numerical Tables workshop report (historiography of ancient tables, not a mathematical research problem)

OWR-4802-002 | Boundaries Between Formal Tables and Material Arrays

History of Numerical Tables workshop report (historiography of ancient tables, not a mathematical research problem)

OWR-4802-003 | Mathematical Tables in the Digital Era

History of Numerical Tables workshop report (historiography of ancient tables, not a mathematical research problem)

OWR-4802-004 | Scope of Digital Mathematical Tables

History of Numerical Tables workshop report (historiography of ancient tables, not a mathematical research problem)

OWR-4802-005 | Interpolation in Medieval Astronomical Tables

History of Numerical Tables workshop report (historiography of ancient tables, not a mathematical research problem)

OWR-4802-006 | Mathematical Classification of Plimpton 322

History of Numerical Tables workshop report (historiography of ancient tables, not a mathematical research problem)

OWR-4802-007 | Generation Algorithms for Plimpton 322

History of Numerical Tables workshop report (historiography of ancient tables, not a mathematical research problem)

OWR-4802-008 | Tabular Meaning of Plimpton 322

History of Numerical Tables workshop report (historiography of ancient tables, not a mathematical research problem)

OWR-4807-004 | Frame-Norm-Preserving Operators

Unrecoverable OWR statement (The official report poses the classification and then immediately gives its answer as a theorem, so the extracted question is not left open.)

OWR-4807-005 | Signal Approximation by Gabor Multipliers

Unrecoverable OWR statement (The official report presents this as an approximation setup followed by variational solutions and inverse algorithms rather than as a standa)

OWR-4807-007 | Stable Coefficient Recovery from Bandlimited Samples

Unrecoverable OWR statement (The official report asks these recovery questions and then answers both affirmatively under explicit hypotheses, so the extraction is not an)

OWR-4990375-008 | Paramodular Correspondence for Abelian Surfaces and Fourfolds

Duplicate/merged OWR extraction (The official report confirms that this is a duplicate extraction of the detailed paramodular correspondence retained in OWR-4990375-007. No)

OWR-4990375-007 / p.163

OWR-4990375-011 | Kodaira Dimension of Odd Minimal Strata

Duplicate/merged OWR extraction (The official report confirms that this is a duplicate extraction of the Kodaira-dimension conjecture retained in OWR-4990375-010. No separat)

OWR-4990375-010 / p.696

OWR-5146-001 | Answered Sullivan-Model Existence Question

Answered in the source or not an open problem (solved (yes; answered in the source))

OWR-5146-004 | Duplicate Rational Toral-Rank Conjecture

Duplicate/merged OWR extraction (This record restates the rational toral-rank conjecture represented canonically by OWR-5146-003 from the same official report, changing only)

OWR-5146-003 / p.1243

OWR-5154-008 | Existence of Nonsofic Groups

Duplicate of canonical problem ALG-008

ALG-008 / p.216

OWR-5155-003 | Homological Computability of Restricted Singularity Classes

Unrecoverable OWR statement (The official report poses this as a rhetorical transition and immediately explains the homological computability of the class of maps. No se)

OWR-5157-002 | Expository Random-Matrix Framing Question

Unrecoverable OWR statement (The sentence is a rhetorical framing question at the start of a survey of established spectral and eigenvector universality results; the rep)

OWR-5158-004 | Duplicate Teichmüller-Metric Question

Duplicate/merged OWR extraction (This is the third subquestion of the same-report three-part problem represented canonically by OWR-5158-003, with only examples of metrics a)

OWR-5158-003 / p.993

OWR-701-003 | Entropy-Stable Paths for Approximate Riemann States

Unrecoverable OWR statement (The official report asks this as an expository design question and then answers it in the same abstract by choosing subpaths along approxima)

OWR-7155447-001 | Reading Practices and Arguments in Mathematical Classics

Duplicate/merged OWR extraction (The official report shows that this workshop-level overview merges availability, reading-practice, and mathematical-argument themes that are)

OWR-7155449-006 | Duplicate K3 Hilbert-Scheme Conjecture Suite

Duplicate/merged OWR extraction (The official Oberwolfach report confirms that Conjectures 2-4 form one contiguous suite on quasi-Jacobi structure, multiple covers, and the)

OWR-7155449-005 / p.723

OWR-723-001 | Circle Discrepancy in Balanced Lattice Colorings

Already answered in the original Oberwolfach workshop report (not an open problem)

OWR-730-012 | Duplicate Planar Min-Bisection and Bicriteria Extraction

Duplicate/merged OWR extraction (The official Oberwolfach report was checked directly. This extraction repeats the same source problem as OWR-730-011 and OWR-730-013/OWR-730)

OWR-730-011 / p.2066 OWR-730-013 / p.2057 OWR-730-014 / p.2096

OWR-730-015 | Duplicate Bicriteria Spanning-Tree Enumeration

Duplicate/merged OWR extraction (The official Oberwolfach report was checked directly. This extraction repeats the same source problem as OWR-730-014 and is only a trailing)

OWR-730-014 / p.2096

OWR-734-010 | Duplicate Lefschetz Property Conjecture

Duplicate/merged OWR extraction (This is a redundant prose extraction of the Lefschetz conjecture stated precisely in OWR-734-011. No separate clean statement is promoted; t)

OWR-734-011 / p.1703

OWR-734-017 | Single-Wave Uniqueness for Impenetrable Scatterers

Unrecoverable OWR statement (The cited official report on combinatorial commutative algebra contains no inverse-scattering problem; this statement appears to have been s)

OWR-735-002 | Fourier Reconstruction of Discrete Objects

Unrecoverable OWR statement (The cited official report on fast methods for non-local operators contains no discrete Fourier-reconstruction problem; the statement belongs)

OWR-736-002 | Duplicate Warped Wavelet-Basis Problem

Duplicate/merged OWR extraction (The official Oberwolfach report was checked directly. This extraction repeats the same source problem as OWR-736-001 and paraphrases the sam)

OWR-736-001 / p.1428

OWR-736-003 | Duplicate Warped Wavelet-Basis Extraction

Duplicate/merged OWR extraction (The official Oberwolfach report was checked directly. This extraction repeats the same source problem as OWR-736-001 and is byte-identical a)

OWR-736-001 / p.1428 OWR-736-002 [not in active corpus]

OWR-737-009 | Redundant Extraction - Canonical Pseudo-Exponential Fields

Duplicate/merged OWR extraction (The primary Oberwolfach report was checked directly. The extracted text duplicates OWR-737-008 verbatim and does not contain the distinct pr)

OWR-737-008 / p.2006

OWR-742-001 | Duplicate Complex-Interpolation Compactness Question

Duplicate/merged OWR extraction (This is a redundant broad extraction of the complex-interpolation compactness question stated precisely as OWR-742-002. No separate clean st)

OWR-742-002 / p.1299

OWR-782-002 | Duplicate Extremal Modular-Form Congruence

Duplicate/merged OWR extraction (The official Oberwolfach report was checked directly. This extraction repeats the same source problem as OWR-782-001 and contains no indepen)

OWR-782-001 / p.48

OWR-782-006 | Low-Moment Detection of Reductive Subgroups

Answered in the source or not an open problem (solved (yes for $d \geq 5$, with one exception; answered in the source))

OWR-782-008 | Duplicate Saito Positivity Conjecture

Duplicate/merged OWR extraction (The official Oberwolfach report was checked directly. This extraction repeats the same source problem as OWR-782-007 and restates the same S)

OWR-782-007 / p.166

OWR-787-007 | Minimal Families of Nonisomorphic Subgroup Embeddings

Unrecoverable OWR statement (The official report explicitly says that its final theorem answers this minimal-family question positively. No separate clean open statement)

OWR-792-015 | Redundant Extraction - Bank Capital-Ratio Control

Duplicate/merged OWR extraction (The primary Oberwolfach report was checked directly. This record repeats the core text already captured, with fuller report context, by OWR-)

OWR-792-014 / p.2109

OWR-831-004 | Finite-Field Erdős-Szemerédi Sum-Product Bounds

Answered in the source or not an open problem (solved (answered in the source))

OWR-831-010 | Rhetorical Quantum-State Vector-Length Question

Duplicate/merged OWR extraction (This is the title-level rhetorical framing of the abstract, not a standalone mathematical statement; the actual tree-size conjectures are re)

OWR-831-012 / p.2079

OWR-831-013 | Resolved Triple-Product Group Challenge

Unrecoverable OWR statement (The official report poses this challenge and then constructs such groups in the same abstract, obtaining nontrivial bounds on the matrix-mul)

OWR-832-008 | Volume Conjecture for Knot Polynomials

Duplicate of canonical problem TOP-002

TOP-002 / p.1244

OWR-8415336-014 | Density of Finite-Order Absolutely Periodic Billiard Orbits

Unrecoverable OWR statement (The official report states this density construction as Theorem 1, not as an open problem. No separate clean statement is promoted, and the)

OWR-8415342-004 | Duplicate Hiraga-Ichino-Ikeda-Langlands Conjecture

Duplicate/merged OWR extraction (The official Oberwolfach report confirms that this extraction repeats the Hiraga-Ichino-Ikeda-Langlands Plancherel-density conjecture alread)

OWR-8415342-002 / p.134

OWR-8415342-005 | Formal Degrees for Symplectic and Even Orthogonal Groups

Unrecoverable OWR statement (The official report labels the extracted assertion Theorem 1.3 and states it as a proved special case, not an open problem.)

OWR-8415342-006 | Spectral Expansion of Twisted Orbital Integrals

Unrecoverable OWR statement (The official report confirms that the extraction is a theorem-level spectral-expansion result used in the proof of Theorem 1.3, not an open)

OWR-8415342-019 | Beilinson-Drinfeld Equivalence and Restricted Geometric Langlands

Unrecoverable OWR statement (The official report confirms that this extraction is the evidence paragraph following the restricted geometric Langlands conjecture, which i)

OWR-8415345-005 | Bridge Position for Surfaces in Trisected Four-Manifolds

Answered in the source or not an open problem (solved (a theorem, not a problem))

OWR-8415347-001 | Unspecified Quantum-Groups Workshop Problem

Unrecoverable OWR statement (The official report confirms that the extraction is a table-of-contents fragment, not a standalone open problem.)

OWR-8415347-002 | Unspecified Quantum-Groups Open Problem

Unrecoverable OWR statement (The official report confirms that the extraction is a table-of-contents fragment, not a standalone open problem.)

OWR-8415347-012 | Resolved Witt-Group Question on Anisotropic Modular Categories

Answered in the source or not an open problem (solved (yes; answered in the source))

OWR-8415350-001 | Unspecified Surface Singularity Conjecture

Unrecoverable OWR statement (The official report confirms that this record is only a table-of-contents fragment and contains no identifiable conjecture. No separate clea)

OWR-8415350-002 | Non-Archimedean Wilkie-Type Point-Counting Bounds

Unrecoverable OWR statement (The official contribution reports results in each of the listed non-Archimedean settings, including a proved Pfaffian analogue of Wilkie's c)

OWR-8415350-003 | Floer Cohomology and Contact Loci of Jets

Unrecoverable OWR statement (The official contribution states immediately after the displayed conjecture that the asserted isomorphism is true in general as a theorem in)

OWR-8415350-008 | Unspecified Rank-One Del Pezzo Surface Conjecture

Duplicate/merged OWR extraction (The phrase 'the latter conjecture remains open' refers back to the Negativity Conjecture retained in OWR-8415350-007; the following rank-one)

OWR-8415350-007 / p.708

OWR-8415352-005 | Symmetry Structure of Mutually Unbiased Bases

Unrecoverable OWR statement (The official report uses this question as an expository heading and immediately identifies the wreath-product symmetry acting on the mutuall)

OWR-8415353-001 | Open Problems in Thin Groups and Super-Approximation

Unrecoverable OWR statement (The official source passage is a table-of-contents fragment and contains no mathematical claim. No separate clean statement is promoted; the)

OWR-8415353-004 | Zaremba Conjecture for Bounded Continued Fraction Digits

Duplicate/merged OWR extraction (The official report states the same Zaremba conjecture already represented by the source-verified record OWR-8415353-003 in this report. No)

OWR-8415353-003 / p.198

OWR-8415355-001 | Open Problems in Geometric Representation Theory

Unrecoverable OWR statement (The official source passage is a table-of-contents fragment and contains no mathematical claim. No separate clean statement is promoted; the)

OWR-8415355-005 | Langlands Dual Parametrization from Baxter Polynomiality

Duplicate/merged OWR extraction (The official passage only gives evidence for the Langlands-dual parametrization conjecture already represented by OWR-8415355-004 in this re)

OWR-8415355-004 / p.294

OWR-8415356-001 | Unspecified Combinatorial Optimization Problem

Unrecoverable OWR statement (The official report shows that the extract is a table-of-contents fragment listing several later contributions, not a standalone mathematica)

OWR-8415356-015 | Linear Bounds for Minimally Integer-Infeasible Systems

Duplicate/merged OWR extraction (The official report confirms that this is a duplicate extraction of the minimally integer-infeasible systems problem retained in OWR-8415356)

OWR-8415356-014 / p.2090

OWR-8415356-019 | Better-Than-Two Approximation for Multiplicative Connectivity Augmentation

Duplicate/merged OWR extraction (The official report confirms that this is a duplicate extraction of the multiplicative connectivity augmentation problem retained in OWR-841)

OWR-8415356-018 / p.2063

OWR-8415356-022 | Balanced Signings in the Subtour Polytope

Duplicate/merged OWR extraction (The official report confirms that this is a duplicate extraction of the balanced-signing question retained in OWR-8415356-021. No separate c)

OWR-8415356-021 / p.2062

OWR-8415356-026 | Deterministic Optimization of Top-k Perfect-Matching Edges

Duplicate/merged OWR extraction (The official report confirms that this is a duplicate extraction of the top-k perfect-matching question retained in OWR-8415356-025. No sepa)

OWR-8415356-025 / p.2073

OWR-8415359-005 | Probabilistic Box Models

Unrecoverable OWR statement (The linked report was inspected: this is a rhetorical transition immediately followed by a definition of quantum functions, not a freestandi)

OWR-8415359-007 | Dimension-Complexity Tradeoffs in Quantum-Function Testing

Unrecoverable OWR statement (The linked report was inspected: the apparent question is immediately answered by the stated corollary of $\mathrm{MIP}^*=\mathrm{RE}$, so t)

OWR-8415359-014 | Average-Case Metacomplexity Characterizations of One-Way Functions

Unrecoverable OWR statement (The linked report was inspected: this passage surveys proved characterizations of one-way functions and contains no explicit unresolved prob)

OWR-8415361-001 | Unspecified Higher-Rank Dynamics Conjecture

Duplicate/merged OWR extraction (The official report shows that this is introductory context pointing to the higher-rank rigidity conjecture retained in OWR-8415361-002. No)

OWR-8415361-002 / p.1513

OWR-8415362-001 | Cluster Algebras Scattering Amplitudes and Positive Geometries

Unrecoverable OWR statement (The official source passage is the workshop abstract describing its themes, not a mathematical problem or conjecture. No separate clean stat)

OWR-8415364-001 | Kannan-Lovasz-Simonovits Spectral Gap Conjecture

Duplicate/merged OWR extraction (The official report shows that this workshop-level introduction merely mentions the Kannan-Lovász-Simonovits conjecture, which is retained i)

OWR-8415364-006 / p.886

OWR-8415364-002 | Unspecified Convex Geometry Conjecture

Unrecoverable OWR statement (The official report shows that this extract is an incomplete contents fragment and does not state a standalone mathematical problem. No sepa)

OWR-8415364-003 | Unspecified Convex Geometry Conjecture

Unrecoverable OWR statement (The official report shows that this extract contains only a conjecture label and no recoverable mathematical statement. No separate clean st)

OWR-8415364-004 | Foundations of Convex Algebraic Geometry

Unrecoverable OWR statement (The official report immediately answers this expository heading by defining convex algebraic geometry; it is not posed as an open mathematic)

OWR-8415364-005 | KLS Isoperimetric Coefficient Bound for Log-Concave Measures

Duplicate/merged OWR extraction (The official report confirms that this is a duplicate extraction of the Kannan-Lovász-Simonovits conjecture retained in OWR-8415364-006. No)

OWR-8415364-006 / p.886

OWR-8415364-007 | KLS Isoperimetric Coefficient Bound for Log-Concave Measures

Duplicate/merged OWR extraction (The official report confirms that this is a duplicate extraction of the Kannan-Lovász-Simonovits conjecture retained in OWR-8415364-006. No)

OWR-8415364-006 / p.886

OWR-8415364-008 | Unspecified Log-Concave Measure Conjecture

Unrecoverable OWR statement (The official report places this fragment inside proved results on log-concave measures and does not state an open problem. No separate clean)

OWR-9790352-001 | Unspecified Structural Graph Theory Problem

Unrecoverable OWR statement (The official report shows that this is workshop-level introductory prose rather than a standalone mathematical problem. No separate clean st)

OWR-9790352-002 | Unspecified Structural Graph Theory Conjecture

Unrecoverable OWR statement (The official report shows that this extract is a table-of-contents fragment without a recoverable standalone statement. No separate clean st)

OWR-9790352-003 | Unspecified Structural Graph Theory Conjecture

Unrecoverable OWR statement (The official report shows that this extract is a second table-of-contents fragment without a recoverable standalone statement. No separate c)

OWR-9790352-005 | Local Separators in Large Networks

Unrecoverable OWR statement (The official report immediately answers the rhetorical heading by defining local separators, so it is not an open problem. No separate clean)

OWR-9790352-006 | Unspecified Graph Structure Problem

Unrecoverable OWR statement (The official report answers this figure-specific question in the following sentence; the extract is contextual exposition rather than an ope)

OWR-9790352-008 | Report-Proved Logarithmic Treewidth Bound

Unrecoverable OWR statement (The official report states this logarithmic-treewidth conjecture and then proves it as a theorem in the same contribution, so it must not be)

OWR-9790352-015 | Unspecified Colin de Verdiere Graph Parameter Problem

Unrecoverable OWR statement (The official report shows that the extract states a theorem and corollary about the Colin de Verdière parameter, not an open problem. No sep)

OWR-9790352-016 | Unspecified Nonrepetitive Graph Coloring Problem

Unrecoverable OWR statement (The official report uses the extracted formula to record a proved nonrepetitive-coloring bound rather than a standalone open problem. No sep)

OWR-9790352-020 | Chi-Bounds and Stable Sets in Burling Graphs

Duplicate/merged OWR extraction (The official report confirms that this is a partial duplicate of the Burling-graph questions retained in OWR-9790352-019. No separate clean)

OWR-9790352-019 / p.1859

OWR-9790352-022 | Unspecified Alspach Rainbow Matching Conjecture

Unrecoverable OWR statement (The official report shows that this fragment reports the asymptotic resolution of Alspach's conjecture and does not state a complete open pr)

OWR-9790352-023 | Aharoni-Berger Rainbow Matching Conjecture

Duplicate/merged OWR extraction (This is a later cross-report duplicate of the Aharoni-Berger rainbow-matching conjecture canonically retained in OWR-16763-030. No separate)

OWR-16763-030 / p.1695

OWR-9790352-024 | Unspecified Alspach Rainbow Matching Conjecture

Unrecoverable OWR statement (The official report shows that this is another fragment reporting the asymptotic resolution of Alspach's conjecture, not a standalone open p)

OWR-9790352-028 | Density Threshold for Rainbow Clique Subdivisions

Duplicate/merged OWR extraction (The official report confirms that this is a corrupted duplicate of the rainbow clique-subdivision question retained in OWR-9790352-027. No s)

OWR-9790352-027 / p.1782

OWR-9790354-002 | Type-I Conjecture Section Heading

Unrecoverable OWR statement (The official report confirms that the extraction is only a section heading and an incomplete setup duplicated by the following complete conj)

OWR-9790355-001 | Unspecified Multiscale Complex Media Modeling Problem

Unrecoverable OWR statement (The official report shows that this is broad workshop context mentioning many questions without stating a recoverable standalone target. No)

OWR-9790357-001 | Convolutional Reconstruction in Many Interface Field Models

Unrecoverable OWR statement (The official source says only that several questions remain and then describes a reconstruction procedure; it does not state an independentl)

OWR-9790358-003 | Unspecified Polynomial Interpolation Conjecture

Unrecoverable OWR statement (The official report shows that this extract is a contents fragment and does not state a recoverable standalone problem. No separate clean st)

OWR-9790358-005 | Higher-Dimensional GC Set Counterexamples

Unrecoverable OWR statement (The official report recounts known higher-dimensional counterexamples and unsuccessful approaches rather than posing a new standalone open p)

OWR-9790358-006 | Gasca-Maeztu Maximal Line Conjecture

Duplicate/merged OWR extraction (The official report confirms that this is a duplicate extraction of the Gasca-Maeztu conjecture retained in OWR-9790358-001. No separate cle)

OWR-9790358-001 / p.242

OWR-9790358-007 | Structure of n-Independent and GCn Interpolation Sets

Unrecoverable OWR statement (The official report presents descriptive background about interpolation sets but does not formulate a standalone open mathematical target. N)

OWR-9790358-001 / p.242

OWR-9790359-004 | Constraint-Satisfaction Table Caption

Unrecoverable OWR statement (The official report confirms that the extraction is a table caption summarizing a taxonomy, not a standalone open mathematical problem.)

OWR-9790364-001 | Unspecified Hypergeometric Positivity Problem

Unrecoverable OWR statement (The official report shows that this is a contents fragment without a recoverable standalone hypergeometric-positivity problem. No separate c)

OWR-9790364-003 | Unspecified Laguerre-Polya Density Criterion Problem

Unrecoverable OWR statement (The official report presents survey context about a density criterion but does not state a complete standalone open problem. No separate cle)

OWR-9790367-004 | Strength of Semisimple TQFT Invariants

Answered in the source or not an open problem (solved (answered in the source))

SET-001 | The Continuum Hypothesis
